Dedicated to all
past and present contributors
and
supporters of Toronto Notes
who have made the production of the 2018 edition possible!

The Toronto Notes for Medical Students is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto’s Faculty of Medicine and beyond. Programs that have received Toronto Notes for Medical Students funding include:

**Community Affairs Projects**
- Saturday Program for Inner City High School and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
  - Let's Talk Science
  - Growing Up Healthy

**Annual Faculty Showcase Events**
- Daffodil, in support of the Canadian Cancer Society
- Earhtones Benefit Concert
- Convocation and Ceremonies

**Scholarships and Bursaries**
- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

**Medical School Clubs**
- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

**Other Events**
- Save a Child's Heart
- Australian Medical School Association Conference
- Medical Student Research Day
- Ontario Medical Students Weekend (OMSW)
- OMSA's Medical Student Education Research Grant (MSERG)

**Note:**
Many of you have wondered about the Toronto Notes logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius’ healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O’Brien, MD
Class of 2009, M.D. Program, University of Toronto
Dear Readers,

As the Editors-in-Chief of Toronto Notes 2018, we are proud to present the 34th Edition!

Toronto Notes began humbly in 1985 from a set of student notes circulated among medical students at the University of Toronto. Over time, Toronto Notes has grown into one of the premier study resources for generations of medical trainees in Canada and abroad. This rich history solidified our commitment to publish a comprehensive study resource for medical students engaged in clinical rotations and studying for both the Canadian MCCQE Part 1 and USMLE Step 2.

For the past 33 years we have remained committed to our original vision. The 2018 edition of Toronto Notes contains significant improvements and new editions including:

1. A brand new Medical Genetics chapter with evidence based medicine highlights.
2. Updated versions of the Clinical Handbook and STAT Notes that are more concise, with new figures and additions.
3. An updated website featuring a colour atlas, ECG and heart sound tutorials, essentials of medical imaging, and over 50 OSCE practice questions and scenarios.
4. A significantly improved interactive eBook with many new high-quality colour images.
5. An updated Toronto Notes Quiz App, which is available for free on iTunes and Google Play. This app contains hundreds of questions allowing users to test themselves on the content contained within Toronto Notes.

Toronto Notes 2018 is produced by Toronto Notes for Medical Students Inc., which is a non-for-profit organization supporting various charity organizations and medical student initiatives in the city of Toronto and across the globe. This year, sponsored organizations included Community Affairs, the Ontario Medical Student Weekend (OMSW), the University of Toronto Class Councils, Save A Child's Heart, Earth Tones, Medical Student Research Day (MRSD) The Medical Student Education Research Grant (MSERG), Daffydid, the Conference of the Australian Medical School Association, among others. We would like to thank you for supporting these initiatives through your purchase of Toronto Notes 2018.

We would like to highlight the exceptional work of our team, composed of over 150 medical students, medical illustrators, and faculty members at the University of Toronto Faculty of Medicine. Without the tireless effort expended by these individuals, the production of Toronto Notes 2018 would not have been possible. In particular, we would like to highlight the work of the executive team, all of whom made personal sacrifices in balancing their clinical and academic duties with the responsibilities asked of them: our production managers, Ilya Mukovozov and Kirill Zaslavsky, our associate editors, Graham Mazereeuw, Samik Doshi, Mark Shafarenko, Sangwoo Leem, Tara Tofighi, Sheliza Halani, and our EBM editors, Alexander Sapa, Keeth Krishnan, Shubham Shan, Jin Kyu Kim, Sukhmani Sodhi, Arnav Agarwal. We also want to highlight the work of Rajkumari Chatterjee from University of Toronto Bookstore, who has contributed to the production of Toronto Notes for the past ten years, and has been instrumental in the annual launch of the Toronto Notes Ebook. Lastly, we would like to thank our partners at Type & Graphics Inc., particularly Enrica Aguilera, for their assistance during the production of Toronto Notes 2018.

We would like to continue to encourage feedback – this year's edition saw many improvements thanks to suggestions from our readers. We hope that Toronto Notes 2018 enhances your medical knowledge and allows you to perform better on both your clinical rotations and licensing exams. On behalf of the Toronto Notes 2018 team, we wish you success in your studies and academic endeavours.

Sincerely,

Tina Binesh Marvasti, MSc, MD/PhD Candidate and Sydney McQueen, MSc, MD/PhD Candidate
Editors-in-Chief, Toronto Notes 2018
MD Program, University of Toronto
Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 34th edition of this text was made possible with their contributions.

How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of Toronto Notes allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Icon Name</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Key Objectives Icon" /></td>
<td>Key Objectives</td>
<td>This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.</td>
</tr>
<tr>
<td><img src="image2" alt="Clinical Pearl Icon" /></td>
<td>Clinical Pearl</td>
<td>This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.</td>
</tr>
<tr>
<td><img src="image3" alt="Memory Aid Icon" /></td>
<td>Memory Aid</td>
<td>This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.</td>
</tr>
<tr>
<td><img src="image4" alt="Clinical Flag Icon" /></td>
<td>Clinical Flag</td>
<td>This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.</td>
</tr>
<tr>
<td><img src="image5" alt="Cross-Reference Icon" /></td>
<td>Cross-Reference</td>
<td>This icon is found in sidebars of the text. It indicates a cross-reference for information that is discussed in a separate chapter.</td>

Chapter Divisions

To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

**Basic Anatomy/Physiology Review**
- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

**Common Differential Diagnoses**
- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

**Diagnoses**
- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

**Common Medications**
- a quick reference section for review of medications commonly prescribed
# Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor
To convert from the SI unit to the conventional unit, **divide** by conversion factor

Further information on these topics can be found in the Objectives of the Considerations of the Legal, Ethical and Organizational Aspects of the Practice of Medicine (CLEO) – which can be downloaded free of charge from the Medical Council of Canada website at http://mcc.ca/wp-content/uploads/CLEO.pdf

Canadian law applicable to medical practice varies between jurisdictions and changes over time. Criminal law is nationwide, but non-criminal (civil) law varies between provinces. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.
The legal foundation of the Canadian health system is based on:

- two constitutional documents:
  1. Constitution Act (1867): deals primarily with the jurisdictional power between federal and provincial governments
  2. The Canadian Charter of Rights and Freedoms (1982): does not guarantee a right to health care but, given government’s decision to finance health care, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians’ mobility rights, etc.)
- two statutes:
  1. Canada Health Act (1984) outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
  2. Canada Health and Social Transfer Act (1996): federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces’ discretion
History of the Canadian Health Care System

1867 **British North America Act** (now **Constitution Act**) establishes Canada as a confederacy
- “establishment, maintenance, and management of hospitals” under provincial jurisdiction

1965 **Royal Commission on Health Services** (Hall Commission) recommends federal leadership
and financial support with provincial government operation

1984 **Canada Health Act** passed by federal government
- replaces **Medical Care Act** (1966) and **Hospital Insurance and Diagnostic Services Act** (1957)
- provides federal funds to provinces with universal hospital insurance
- maintains federal government contribution at 50% on average, with poorer provinces receiving
  more funds
- medical insurance must be “comprehensive, portable, universal, and publicly administered”
- bans extra-billing by new fifth criterion: accessibility

1996 **Canada Health and Social Transfer Act** passed by federal government
- federal government gives provinces a single grant for health care, social programs, and
  post-secondary education; division of resources at provinces’ discretion

2001 **Kirby and Romanow Commissions** appointed

  **Kirby Commission** (final report, October 2002)
  - examines history of health care system in Canada, pressures and constraints of current health
  care system, role of federal government, and health care systems in foreign jurisdictions

  **Romanow Commission** (final report, November 2002)
  - dialogue with Canadians on the future of Canada’s public health care system

2004 **First Ministers’ Meeting on the Future of Health Care** produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and
  primary care reform

2005 **Chaudié v Quebec**, Supreme Court of Canada decision
- rules that Quebec’s banning of private insurance is unconstitutional under the **Quebec Charter
  of Rights**, given that patients do not have access to those services under the public system in a
timely way

2011 First progress report by the Health Council reviews progress (2004 First Ministers’ 10 year plan)
- significant reductions in wait times for specific areas (such as cancer, joint replacement and
  sight restoration), but may have inadvertently caused increases in wait times of other services
- despite large investments into EMRs, Canada continues to have very low uptake, ranking last in the
  **Commonwealth Fund International Health Policy** survey, with only 37% use among
  primary care physicians
- little progress in creating a national strategy for equitable access to pharmaceuticals; however,
  there has been some success in increasing pharmacists’ scope of practice, reducing generic
  drug costs, and implementing drug information systems
- increases in funding to provinces at 6% per annum until the 2016-2017 fiscal year; from then
  onwards, increases tied to nominal GDP at a minimum of 3% per annum

2012 Second progress report by the Health Council reviews progress towards 2004 First Ministers’ 10
year plan
- funding is sufficient; however, more innovation is needed including incentivizing through
  models of remuneration
- 46 recommendations made to address the lack of progress

2014 Expiry of current **10 Year Health Care Funding Agreement** between federal and provincial
governments

2015 Negotiations underway for a new Health Accord with a $3 billion investment over four years to
homecare and mental health services by the elected Liberal government

2017 New 10 year Canada Health Accord reached with a $11.5 billion federal investment over 10 years
to homecare and mental health services and a 3% annual rise in the Canada Health Transfer
(down from 6% in the previous agreement) by the elected Liberal government
Health Care Expenditure and Delivery in Canada

- The projected total health care expenditure in 2016 is expected to reach $228 billion, 11% of the GDP, approximately $6,299 CDN per person.

Sources of Health Care Funding
- 70% of total health expenditure in 2016 came from public-sector funding with 65% coming from the provincial and territorial governments and another 5% from other parts of the public sector: federal direct government, municipal, and social security funds. 30% is from private sources including out of pocket (15%), private insurance (12%) and other (3%).
- Public sector covers services offered on either a fee for service, capitation, or alternate payment plan in physicians’ offices and in hospitals.
- Public sector does not cover services provided by privately practicing health professionals (e.g., dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists, podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC drugs, personal health supplies, and use of residential care facilities.

![Figure 1. Total health expenditure by use of funds, Canada, 2015](https://secure.cihi.ca/free_products/nhex_trends_narrative_report_2015_en.pdf)

Delivery of Health Care
- Hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities.
- Other countries, such as the United States (a mix of public and private funding, as well as private for-profit and private not-for-profit delivery) and the United Kingdom (primarily public funding and delivery) have different systems of delivery.

Physician Licensure and Certification

Table 2. Key Physician Certification and Licensing Bodies in Canada

<table>
<thead>
<tr>
<th>Certification Body</th>
<th>Description</th>
</tr>
</thead>
</table>
| MCC                | Certifies physicians with the LMCC  
LMCC acquired by passing the MCC Qualifying Examination Parts I and II |
| RCPSC              | Certifies specialists who complete an accredited residency program and pass the appropriate exam  
Voluntary membership of the RCPSC is designated FRCP or FRCS |
| CFPC               | Certifies family physicians who complete an accredited residency program and pass the Certification Examination in Family Medicine |
| Licensing Body     | 13 provincial medical regulatory (licensing) authorities  
All postgraduate residents and all practicing physicians must hold an educational or practice license from the licensing body in the province in which they study or practice |
| CPSO               | Membership to the provincial licensing authority is mandatory  
Licensing authority functions include:  
Provide non-transferable licensure to physicians  
Maintaining ethical, legal, and competency standards and developing policies to guide doctors  
Investigating complaints against doctors  
Disciplining doctors guilty of professional misconduct or incompetence  
At times of license revocation and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses that may impact their ability to practice safely) |
• physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation
• self-regulation is based on the premise that the licensing authority must act first and foremost in the interest of the public
• the RCPSC and CFPC are responsible for monitoring ongoing CME and professional development
• certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities

## Role of Professional Associations

<table>
<thead>
<tr>
<th>Association</th>
<th>Description</th>

### Ethical and Legal Issues in Canadian Medicine

#### Introduction to the Principles of Ethics

- ethics addresses:
  1. principles and values that help define what is morally right and wrong
  2. rights, duties, and obligations of individuals and groups
- the practice of medicine assumes there is one code of professional ethics for all doctors and that they will be held accountable by that code and its implications
- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- a fiduciary duty is a legal duty to act solely in another party's interest; one may not profit from the relationship with principals unless he/she has the principal's express consent

<table>
<thead>
<tr>
<th>Principle</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autonomy</td>
<td>Recognizes an individual’s right and ability to decide for himself/herself according to his/her beliefs and values Not applicable in situations where informed consent and choice are not possible or may not be appropriate</td>
</tr>
<tr>
<td>Beneficence</td>
<td>Patient-based ‘best interests’ standard that combines doing good, avoiding harm, taking into account the patient’s values, beliefs, and preferences, so far as these are known Autonomy should be integrated with the physician’s conception of a patient’s medically-defined best interests Aim is to minimize harmful outcomes and maximize beneficial ones Paramount in situations where consent/choice is not possible or may not be appropriate</td>
</tr>
<tr>
<td>Non-Maleficence</td>
<td>Obligation to avoid causing harm; primum non nocere (“First, do no harm”) Limit condition of the Beneficence principle</td>
</tr>
<tr>
<td>Justice</td>
<td>Fair distribution of benefits and harms within a community, regardless of geography or privilege Concept of fairness: Is the patient receiving what he/she deserves – his/her fair share? Is he/she treated the same as equally situated patients? How does one set of treatment decisions impact others? Basic human rights, such as freedom from persecution and the right to have one’s interests considered and respected</td>
</tr>
</tbody>
</table>

---

**Autonomy vs. Competence**

**Autonomy**: the right that patients have to make decisions according to their beliefs and preferences

**Competence**: the ability or capacity to make a specific decision for oneself
CMA Code of Ethics
- the CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians
- the Code of Ethics is:
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - based on the fundamental ethical principles of medicine
  - sources include the Hippocratic Oath, developments in human rights, recent bioethical discussion
  - CMA policy statements address specific ethical issues not mentioned by the code (e.g. abortion, transplantation, and euthanasia)

Confidentiality

Overview of Confidentiality
- a full and open exchange of information between patient and physician is central to a therapeutic relationship
- privacy is the right of patients (which they may forgo) while confidentiality is the duty of doctors (which they must respect barring patient consent or the requirements of the law)
- if inappropriately breached by a doctor, he/she can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of patient autonomy, patients have the right to the following:
  - control of their own information
  - the expectation that information concerning them will receive proper protection from unauthorized access by others (see Privacy of Medical Records, ELOM7)
  - confidentiality may be ethically and legally breached in certain circumstances (e.g. the threat of harm to others)
  - unlike the solicitor-client privilege, there is no ‘physician-patient privilege’ by which a physician, even a psychiatrist, can promise the patient absolute confidentiality
  - physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
  - many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
  - physicians failing to abide by such regulations could be subject to professional or civil actions
- legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting cases in the common law

Statutory Reporting Obligations
- legislation has defined specific instances where public interest overrides the patient’s right to confidentiality; varies by province, but may include:
  1. suspected child abuse or neglect – report to local child welfare authorities (e.g. Children’s Aid Society)
  2. fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see Geriatric Medicine, GM11)
  3. communicable diseases – report to local public health authority (see Population Health and Epidemiology; PH24)
  4. improper conduct of other physicians or health professionals – report to College or regulatory body
  5. vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 days to Office of Registrar General or local municipality; death certificates must be completed by a MD then forwarded to municipal authorities)
  6. reporting to coroners (see Physician Responsibilities Regarding Death, ELOM14)
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

Duty to Protect/Warn
- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detention of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm first established by a Supreme Court of California decision in 1976 (Tarasoff v. Regents of the University of California; supported by Canadian courts
- obliged by the CMAB Code of Ethics and recognized by some provincial/territorial regulatory authorities
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where:
  1. there is a clear risk to identifiable person(s);
  2. there is a risk of serious bodily harm or death; and
  3. the danger is imminent (i.e. more likely to occur than not)

Disclosure for Legal Proceedings
- disclosure of health records can be compelled by a court order, warrant, or subpoena
Privacy of Medical Records
• privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the Canadian Charter of Rights and Freedoms, and the physician's fiduciary duty
• the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, private labs)
• PIPEDA has been superseded by provincial legislation in many provinces, such as the Ontario Personal Health Information Protection Act, which applies more specifically to health information

Duties of Physicians with Regard to the Privacy of Health Information
• inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
• obtain the patient's expressed consent to disclose information to third parties
  ■ under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between health care team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box."
  ■ provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
  ■ provide secure storage of information and implement measures to limit access to patient records
  ■ ensure proper destruction of information that is no longer necessary
  ■ regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces
• CPSO published policy is designed to help Ontario physicians understand legal and professional obligations set out under the Regulated Health Professions Act, 1991, the Medicine Act, 1991, and the Personal Health Information Protection Act, 2004. This includes regulations regarding express or implied consent, incapacity, lock boxes, disclosure under exceptional circumstances, mandatory reporting, ministry audits, subpoenas, court orders, and police, as well as electronic records and voice messaging communications: http://www.cpso.on.ca/Policies-Publications/Policy/Confidentiality-of-Personal-Health-Information
• it is the physician's responsibility to ensure appropriate security provisions with respect to electronic records and communications

Consent and Capacity

Ethical Principles Underlying Consent and Capacity
• consent is the autonomous authorization of a medical intervention by a patient
• usually the principle of respect for patient autonomy overrides the principle of beneficence
• where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
• there is a duty to discover, if possible, what the patient would have wanted when capable
• central to determining best interests is understanding the patient's values, beliefs, and cultural or religious background
• more recently expressed wishes take priority over remote ones
• patient wishes may be verbal or written
• patients found incapable to make a specific decision should still be involved in that decision as much as possible
• agreement or disagreement with medical advice does not determine findings of capacity/incapacity
• however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed

Four Basic Requirements of Valid Consent
1. Voluntary
• consent must be given free of coercion or pressure (e.g. from parents or other family members who might exert undue influence)
• the physician must not deliberately mislead the patient about the proposed treatment
2. Capable
• the patient must be able to understand and appreciate the nature and effect of the proposed treatment
3. Specific
• the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)
4. Informed
• sufficient information and time must be provided to allow the patient to make choices in accordance with his/her wishes, including:
  ■ the nature of the treatment or investigation proposed and its expected effects
  ■ all significant risks and special or unusual risks
  ■ alternative treatments or investigations and their anticipated effects and significant risks
  ■ the consequences of declining treatment
  ■ risks that are common sense need not be disclosed (i.e. bruising after venipuncture)
  ■ answers to any questions the patient may have
- the reasonable person test – the physician must provide all information that would be needed “by a reasonable person in the patient’s position” to be able to make a decision
- disclose common adverse events (>1/200 chance of occurrence) and serious risks (e.g. death), even if remote
- it is the physician’s responsibility to make reasonable attempts to ensure that the patient understands the information
- physicians should not withhold information about a legitimate therapeutic option based on personal conscience (e.g. not discussing the option of emergency contraception)

Figure 2. Ontario consent flowchart
Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

**Obtaining Legal Consent**
- consent of the patient must be obtained before any medical intervention is provided; consent can be verbal or written, although written is usually preferred
- a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent
- most important component is what the patient understands and appreciates, not what the signed consent form states
- implied (e.g. a patient holding out their arm for an immunization) or expressed
- consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm
- HCCA of Ontario (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g. home care)

**Exceptions to Consent**
1. Emergencies
   - treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
   - emergency treatment should not violate a prior expressed wish of the patient (e.g. a signed Jehovah’s Witness card)
   - if patient is incapable, MD must document reasons for incapacity and why situation is emergent
   - patients have a right to challenge a finding of incapacity as it removes their decision-making ability
   - if a SDM is not available, MD can treat without consent until the SDM is available or the situation is no longer emergent

Criteria For Administration of Treatment for an Incapable Patient in Emergency Situations
- Patient is experiencing extreme suffering
- Patient is at risk of sustaining serious bodily harm if treatment is not administered promptly

Patients may also ask to waive the right to choice (e.g. “You know what’s best for me, doctor”) or delegate their right to choose to someone else (e.g. a family member)

The Supreme Court of Canada expects physicians to disclose the risks that a “reasonable” person would want to know. In practice, this means disclosing minor risks that are common as well as serious risks that happen infrequently, especially those risks that are particularly relevant to a particular patient (e.g. hearing loss for a musician)

Major Exceptions to Consent
- Emergencies
- Public and Mental Health Legislation
- Communicable diseases
2. Legislation
- Mental Health legislation allows for:
  - the detention of patients without their consent
  - psychiatric outpatients may be required to adhere to a care plan in accordance with Community Treatment Orders (see Psychiatry, PS51)
- Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases

3. Special Situations
- public health emergencies (e.g. an epidemic or communicable disease treatment)
- warrant for information by police

Consequences of Failure to Obtain Valid Consent
- treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in exceptions section above)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

Overview of Capacity
- capacity is the ability to:
  - understand information relevant to a treatment decision
  - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
  - capacity is specific for each decision (e.g. a person may be capable to consent to having a chest x-ray, but not for a bronchoscopy)
  - capacity can change over time (e.g. temporary incapacity secondary to delirium)
  - most Canadian jurisdictions distinguish capacity to make healthcare decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
  - a person is presumed capable unless there is good evidence to the contrary
  - capable patients are entitled to make their own decisions
  - capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

Assessment of Capacity
- capacity assessments must be conducted by a physician and, if appropriate, in consultation with other healthcare professionals (e.g. another physician, a mental health nurse)
- clinical capacity assessment may include:
  - specific capacity assessment (i.e. capacity specific to the decision at hand):
    1. effective disclosure of information and evaluation of patient's reason for decision
    2. understanding of:
       - his/her condition
       - the nature of the proposed treatment
       - alternatives to the treatment
       - the consequences of accepting and rejecting the treatment
       - the risks and benefits of the various options
  - for the appreciation needed for decision making capacity, a person must
    - acknowledge the condition that affects him/herself
    - be able to assess how the various options would affect him or her
    - be able to reach a decision and adhere to it, and make a choice, not based primarily upon delusional belief
  - general impressions
  - input from psychiatrists, neurologists, etc.
  - employ "Aid to Capacity Evaluation"
  - a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board), or the courts
  - judicial review is open to patients if found incapable

Treatment of the Incapable Patient in a Non-Emergent Situation
- obtain informed consent from SDM
- an incapable patient can only be detained against his/her will to receive treatment if he/she meets criteria for certification under the Mental Health Act (see Psychiatry, PS50); in such a situation:
  - document assessment in chart
  - notify patient of assessment using appropriate Mental Health Form(s) (Form 42 in Ontario)
  - notify Rights Advisor
Substitute Decision-Makers
- SDMs must follow the following principles when giving informed consent:
  - act in accordance with wishes previously expressed by the patient while capable
  - if wishes unknown, act in the patient’s best interest, asking the following into account:
    1. Values and beliefs held by the patient while capable
    2. Whether well-being is likely to improve with vs. without treatment
    3. Whether the expected benefit outweighs the risk of harm
    4. Whether a less intrusive treatment would be as beneficial as the one proposed
- the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM is not abiding by the above principles

Instructional Advance Directives
- allow patients to exert control over his/her care once they are no longer capable
- the patient sets out his/her decisions about future health care, including who he/she would allow to make treatment decisions on his/her behalf and what types of interventions he/she would want
- takes effect once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a power of attorney for personal care to carry out his/her advance directives
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they are current with their wishes

POWERS OF ATTORNEY
- all Guardians and Attorneys have fiduciary duties for the dependent person

Definitions
- Power of Attorney for Personal Care
  - a legal document in which one person gives another the authority to make personal care decisions (health care, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they become mentally incapable.
- Guardian of the Person
  - someone who is appointed by the Court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care.
- Continuing Power of Attorney for Property
  - legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions.
- Guardian of Property
  - someone who is appointed by the Public Guardian and Trustee or the Courts to look after an incapable person’s property or finances.
- Public Guardian and Trustee
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf.
- Pediatric Aspects of Capacity Covered
  - no age of consent in all provinces and territories except Quebec; consent depends on patient’s decision-making capacity.
  - Quebec has a specific age of consent, but common law and case law deem underage legal minors capable, allowing these individuals to make their own choices.
  - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved (i.e., be provided with information appropriate to their comprehension level).
  - adolescents are usually treated as adults
  - preferably, assessment should still be obtained from patient, even if not capable of giving consent.
  - in the event that the physician believes the SDM is not acting in the child’s best interests, an appeal must be made to the local child welfare authorities.
  - under normal circumstances, parents have right of access to the child’s medical record.

Negligence

Ethical Basis
- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- negligence or malpractice is a form of failure on the part of the physician in fulfilling his/her fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

Legal Basis
- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances
- standard of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing.
- liability arises from physician’s common law duty of care to his/her patients in the doctor/patient relationship (or, in Quebec, from the Civil Code provisions regarding general civil liability)
- action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective province in which the actions occurred.

Most provinces have legislated hierarchies for SDMs, the hierarchy in Ontario is:
- Legally appointed guardian
- Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see Powers of Attorney)
- Representative appointed by the Consent and Capacity Board.
- Spouse or partner
- Child (age 16 or older) or parent (unless the parent has only a right of access)
- Parent with only a right of access
- Sibling
- Other relative(s)
- Public guardian and trustee.

There is no age of consent in Ontario. Capacity is assessed on an individual basis.

Other Types of Capacity Not Covered by the HCCA
- Testamentary (ability to make a will)
- Fitness (ability to stand trial)
- Financial (ability to manage property – Form 21 of the Mental Health Act)
- Personal (ability to care for oneself on a daily basis)

Errors of care are compatible with non-negligent care if they are ones that a reasonably cautious and skilled MD could make (i.e., mistakes can be made due to ‘honest error’).

Four Basic Elements for Action Against a Physician to Succeed in Negligence
1. A duty of care owed to the patient (i.e., doctor/patient relationship must be established)
2. A breach of the standard of care
3. Some harm or injury to the patient
4. The harm or injury must have been caused by the breach of the duty of care.
Truth-Telling

Ethical Basis
- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed decisions about health care and their lives

Legal Basis
- required for valid patient consent (see Consent and Capacity, ELOM7)
  - goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision (“standard of disclosure”)
  - withholding information can be a breach of fiduciary duty and duty of care
  - obtaining consent on the basis of misleading information can be seen as negligent

Evidence about Truth Telling
- most patients want to know what is wrong with them
- although many patients want to protect family members from bad news, themselves would want to be informed in the same situation
- truth-telling improves adherence and health outcomes
- informed patients are more satisfied with their care
- negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

Challenges in Truth-Telling

Medical Error
- medical error may be defined as ‘preventable adverse events (AEs)’ caused by the patient’s medical care and not the patient’s underlying illness; some errors may be identified before they harm the patient, so not all error is truly ‘adverse’
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient’s family and reported to the appropriate health authorities
- physicians should disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  - negligence is a legal determination
  - error is not equal to negligence (see Negligence, ELOM6)
- disclosure allows the injured patient to seek appropriate corrective treatment promptly
- physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
- physicians should offer apologies or empathic expressions of regret (e.g. “I wish things had turned out differently”) as these can increase trust and are not admissions of guilt or liability
- Apology Acts across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

Breaking Bad News
- ‘bad news’ may be any information that reveals conditions or illnesses threatening the patient’s sense of well-being
- poorly done disclosure may be as harmful as non-disclosure
  - caution patients in advance of serious tests and disclose possible bad findings
  - give time for patient to reflect prior to receiving such news
  - give warnings of impending bad news by reviewing prior discussions
  - provide time for the patient and questions
  - adequate supports and strategies should always be provided following disclosure of difficult news
- SPIKES protocol was developed to facilitate “breaking bad news”
  - SETTLE and LISTENING SKILL
  - Patient PERCEPTIONS of condition and seriousness
  - INVITATION from patient to receive information
  - KNOWLEDGE - provide medical facts
  - Explore EMOTIONS and EMPATHIZE
  - STRATEGY and SUMMARY

Arguments Against Truth-Telling
- may go against certain cultural norms and expectations
- may lead to patient harm and increased anxiety
- 10-20% of patients prefer not to be informed
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

Exceptions to Truth-Telling
- a patient may waive his/her right to know the truth about their situation (i.e. decline information that would normally be disclosed) when:
  - the patient clearly declines to be informed
  - a strong cultural component exists that should be respected and acknowledged
  - the patient may wish others to be informed and make the medical decisions for him/her
the more weighty the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
- ‘emergencies’: an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
- ‘therapeutic privilege’
  • withholding of information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress or physical harm to the patient
  • clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones and is a defence of non-disclosure that is rarely accepted anymore
  • it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

Managing Controversial and Ethical Issues in Practice
MCC-CLEO Objectives 1998
- discuss in a non-judgmental manner
- ensure patients have full access to relevant and necessary information
- identify if certain options lie outside of your moral boundaries and refer to another physician if appropriate
- consult with appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

Reproductive Technologies

Overview of the Maternal-Fetal Relationship
- in general, maternal and fetal interests align
- in some situations, a conflict between maternal autonomy and the best interests of the fetus may arise

Ethical Issues and Arguments
- principle of reproductive freedom: women have the right to make their own reproductive choices
- coercion of a woman to accept efforts to promote fetal well-being is an unacceptable infringement of her personal autonomy

Legal Issues and Arguments
- the law upholds a woman’s right to life, liberty, and security of person, and does not recognize fetal rights; key aspects of the mother’s rights include:
  • if a woman is competent and refuses medical advice, her decision must be respected even if the fetus will suffer
  • the fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

Royal Commission on New Reproductive Technologies (1993) recommendations:
1. medical treatment must never be imposed upon a competent pregnant woman against her wishes
2. no law should be used to confine a pregnant woman in the interest of her fetus
3. the conduct of a pregnant woman in relation to her fetus should not be criminalized
4. child welfare should never be used to control a woman’s behaviour during pregnancy
5. civil liability should never be imposed upon a woman for harm done to her fetus during pregnancy

Examples involving the use of established guidelines
- a woman is permitted to refuse HIV testing during pregnancy, even if vertical transmission to fetus results
- a woman is permitted to refuse Caesarean section in labour that is not progressing, despite evidence of fetal distress

Advanced Reproductive Therapies
- includes non-coital insemination, hormonal ovarian stimulation, and IVF
- topics with ethical concerns:
  • donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  • preimplantation genetic testing for diagnosis before pregnancy
  • use of new techniques without patients appreciating their experimental nature
  • embryo status – the Supreme Court of Canada maintains that fetuses are “unique” but not persons under law; this view would likely apply to embryos as well
- access to ART
- private vs. public funding of ART
- social factors limiting access to ART (e.g. same-sex couples)
- the ‘commercialization’ of reproduction

Ethical Appropriate Actions
- Educate patients and address contributors to infertility (e.g. stress, alcohol, medications, etc.)
- Investigate and treat underlying health problems causing infertility
- Wait at least 1 yr before initiating treatment with ART (exceptions – advanced age or specific indicators of infertility)
- Educate and prepare patients for potential negative outcomes of ART
**Fetal Tissue**
- Pluripotent stem cells can currently be derived from human embryonic and fetal tissue.
- Potential uses of stem cells in research:
  - Studying human development and factors that direct cell specialization.
  - Evaluating drugs for efficacy and safety in human models.
  - Cell therapy: Using stem cells grown in vitro to repair or replace degenerated/destroyed/malignant tissues (e.g., Parkinson's disease).
  - Genetic treatment aimed at altering somatic cells (e.g., myocardial or immunological cells) is acceptable and ongoing.

**Induced Abortion**
- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA).
- CMA policy on induced abortion:
  1. Induced abortion should not be used as an alternative to contraception.
  2. Counselling on contraception must be readily available.
  3. Full and immediate counselling services must be provided in the event of unwanted pregnancy.
  4. There should be no delay in the provision of abortion services.
  5. No patient should be compelled to have a pregnancy terminated.
  6. Physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician.
  7. No discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do.
  8. Induced abortion should be uniformly available to all women in Canada and health care insurance should cover all the costs (note: the upper limit of GA for which coverage is provided varies between provinces).
  9. Elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances.

**Ethical and Legal Concerns and Arguments**
- No law currently regulates abortion in Canada.
- It is a woman's medical decision to be made in consultation with whom she wishes; there is no mandatory role for spouse/family.
- 2nd and even 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the woman's health, or if the fetus has died in utero or has major malformations (e.g., anencephaly).

**Prenatal/Antenatal Genetic Testing**
- Uses:
  1. To confirm a clinical diagnosis.
  2. To detect genetic predisposition to a disease.
  3. Allows preventative steps to be taken and helps patient prepare for the future.
  4. Gives parents the option to terminate a pregnancy or begin early treatment.
- Ethical dilemmas arise because of the sensitive nature of genetic information; important considerations of genetic testing include:
  - The individual and familial implications.
  - Its pertinence to future disease.
  - Its ability to identify disorders for which there are no effective treatments or preventive steps.
  - Its ability to identify the sex of the fetus.
  - Ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
    - Obtaining informed consent is difficult due to the complexity of genetic information.
    - Doctor's duty to maintain confidentiality vs. duty to warn family members.
    - Risk of social discrimination (e.g., insurance) and psychological harm.

**Legal Aspects**
- No current specific legislation exists.
- Testing requires informed consent.
- No standard of care exists for clinical genetics but physicians are legally obligated to inform patients that prenatal testing exists and is available.
- A physician can breach confidentiality terms in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention (e.g., familial adenomatous polyposis).

**Genetic Testing: Ethically Appropriate Actions**
- Thorough discussion and realistic planning with patient before testing is done.
- Genetic counseling for delivery of complex information.
End-of-Life Care

Overview of Palliative and End-of-Life Care
- focus of care is comfort and respect for person near death and maximizing quality of life for patient, family, and loved ones
- appropriate for any patient at any stage of a serious or life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

Euthanasia and Medical-Assistance in Dying
- euthanasia: a deliberate act undertaken by one person with the intention of ending the life of another person to relieve that person’s suffering, where the act is the cause of death
- medical-assistance in dying: the administering or prescribing for self-administration, by a medical practitioner or nurse practitioner, of a substance, at the request of a person, that causes their death

Common Ethical Arguments/Opinions
- patient has the right to make autonomous choices about the time and manner of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and forgoing life sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering
- patient autonomy has limits
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death

Legal Aspect
- in Canada, euthanasia is no longer a punishable offence under the Criminal Code of Canada
- in the Carter v. Canada decision of February 2015, physician-assisted suicide ruled to be not criminal, with the decision taking effect in 2016, now postponed to June 2016
- until June 2016, applicants for assistance in dying (MAID - ‘Medical Aid in Dying’) must obtain court sanction (as an exemption to the Criminal Code)
- Bill C-14 (June 17, 2016) legalized MAID by amending the Criminal Code to create exemptions
- refusal of care by the patient that may lead to death as well as requests for a hastened death, ought to be carefully explored by the physician to rule out any ‘reversible’ factors (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice

Acceptable Use of Palliative and End-of-Life Care
- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its ‘natural course’ but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from SDMs, as ruled in Cuthbertson v. Rasouli in 2013 as palliative care would be instituted and consent for that would require SDM consent

Bill C-14 Criteria for MAID
- patient is eligible for health services funding by government of Canada
- at least 18 yr of age, and has capacity for clear and freely given consent
- grievous and irremediable medical condition: in an advanced state of irreversible decline in capability
- suffering intolerable to the patient, no relieved under conditions they consider acceptable
- natural death is reasonably foreseeable

Acceptable Use of Palliative and End-of-Life Care
- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its ‘natural course’ but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from SDMs, as ruled in Cuthbertson v. Rasouli in 2013 as palliative care would be instituted and consent for that would require SDM consent

Physician Responsibilities Regarding Death
- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- Coronor’s Act, 1990 (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs:
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy

Mental Health Outcomes of Family Members of Patients Who Request Physician Aid in Dying

Conclusion
- Results: 95 family members were surveyed, including 59 of those whose loved ones received a lethal prescription and 36 whose loved ones died by lethal ingestion. Among those whose family member requested aid in dying, whether or not the patient accessed a lethal prescription had no influence on subsequent depression, grief, or mental health services use; however, family members of patients who received a lethal prescription were more likely to believe that their loved one’s choices were honored and less likely to have regrets about how the loved one died. Comparing family members of those who requested aid in dying to those who did not reveal no differences in primary mental health outcomes of depression, grief, or mental health services use. Family members of patients who requested aid in dying felt more prepared and accepting of the death than comparison family members.
- Conclusion: Pursuit of aid in dying does not have negative effects on surviving family members and may be associated with greater preparation and acceptance of death.

Notify Coroner if Death Occurs due to:

- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances
Physician Competence and Professional Conduct

CanMEDS Competencies (Ethical/Policy Statement)
- a framework of professional competencies established by the MCC as objectives for the MCC Qualifying Exam
- further information on MCC objectives can be found at www.mcc.ca

Legal Considerations
- physicians’ conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g., the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within his/her medical practice
- the ultimate constraint on MD behaviour with regards to unprofessionalism is ‘conduct unbecoming a physician’, such as inappropriate behaviour with colleagues, conflicts of interest, untruthfulness, unethical billing practices, and sexual impropriety with patients

Common Policies on Physician Conduct
- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and provincial governing body. Important notes on this topic include:
- inappropriate sexual conduct includes intercourse, undue touching, references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
- in specified situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
- physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
- in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Code of Ethics)
- physicians must maintain adequate records for each patient, which include:
- demonstration that care has been continuous and comprehensive
- minimal standards for record-keeping, including readability, diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record, including drugs, a Cumulative Patient profile, all aspects of charting that are required for safe patient care (full standards available at www.cpso.on.ca). Another physician should be able to take over the safe care of the patient based on the record
- records stored for 10 years in most jurisdictions
- although the medical record is the property of the physician or an institution, the patient or the patient’s delegate must be allowed full access to information in the medical record in a reasonable period of time, and can charge a reasonable fee, upon (usually written) request
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records
Table 5. Ethical Principles for Research Involving Human Subjects

- Patient’s participation in research should not put him/her at a known or probable disadvantage with respect to medical care (i.e. cannot deny participants in research ‘known effective care’, such as randomizing some depressed patients to a placebo arm with no treatment)
- Participant’s voluntary and informed choice is usually required, except in special circumstances (i.e. chart reviews without patient contact, or emergency situations for which there is no accepted or helpful standard of care and the proposed intervention is not likely to cause more harm than such patients already face)
- Access to the treatment that is considered standard (i.e. placebo controlled trials are generally acceptable where patients all receive still receive the standard of care, or, if not, are informed about the placebo arm and what that entails)
- Must employ a scientifically valid design to answer the research question (ensured via peer review, expert opinion)
- Must demonstrate sufficient value to justify any risk posed to participants
- Must be conducted honestly (i.e. carried out as stated in the approved protocol)
- Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions
- Patients must not be enticed into risky research by the lure of money and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts
- Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial

Resource Allocation

- **definition:** the distribution of goods and services to programs and people
- **physicians** have the duty to inform patients about therapeutic options even if they are not available
- **physicians** must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
- need and benefit are morally relevant criteria for resource allocation
- gender, sexual orientation, religion, level of education, or age alone are morally irrelevant criteria
- ethical dilemmas that arise when deciding how best to allocate resources
- fair chances vs. best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
- priorities problem: how much priority should the sickest patients receive?
- aggregation problem: modest benefits to many vs. significant benefits to few
- democracy problem: when to rely on a fair democratic process to arrive at a decision

Guiding Principles for Research Ethics

- Respect for persons: informed consent
- Beneficence: harm vs. benefit
- Justice: avoid exploitation/unjustified exclusion

Informed Consent for Research

- Purpose of study
- Sum of funding
- Name and probability of harm and benefits
- Nature of physician’s participation including compensation
- Proposals for research must be submitted to a research ethics board

Randomization is allowed even if there is an efficacious standard if, for example, there are drawbacks to it (such as it doesn’t work for all, has side effects, and is not wanted by all patients). In such cases, there must be a good safety net established to make sure subjects in the placebo arm do not deteriorate (i.e. there must be a safety monitoring plan for such studies)

CMA and CPSO Guidelines for Ethically Appropriate Physician-Industry Relations

- The primary goal should be the advancement of the health of Canadians
- Relationships should be guided by the CMA Code of Ethics
- The physician’s primary obligation is to the patient
- Physicians should avoid any self-interest in their prescribing and referral practices
- Physicians should always maintain professional autonomy, independence, and commitment to the scientific method

Professional Considerations

**Elderly Patient**
- Identify their resuscitation options (CPR or DNR), if applicable
- Check for documentation of advance directives and POA where applicable
- Identify the primary decision-maker (patients, guardian, wards-of-state, emancipated)
- Regarding capacity assessment see Pediatric Aspects of Capacity Covered, ELOM10
- Be wary of custody issues if applicable

**Terminal Ill or Palliative Patient**
- Consider the SPIKES approach to breaking bad news
- What are his/her goals of care (i.e. disease vs. symptom management)?
- Identify advance directives, POA, or SDM, if applicable (see ELOM10)
- Check for documentation of resuscitation options (CPR or DNR) and likelihood of success

**Incapable Patient**
- If not already present, perform a formal capacity assessment
- Identify if the patient has a SDM or who has their POA
- Check the patient’s chart for any Mental Health Forms (e.g. Form 1) or any forms they may have on their person (e.g. Form 42)
Guidelines for Appropriately Allocating Resources

- the physician’s primary obligation is to:
  - protect and promote the welfare and best interests of his/her patients
  - choose interventions known to be beneficial on the basis of evidence of effectiveness
  - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
  - advocate for one’s patients, but avoid manipulating the system to gain unfair advantage for them
  - resolve conflicting claims for scarce resources justly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures
  - inform patients of the impact of cost constraints on care, but in a sensitive way
  - seek resolution of unacceptable shortages at the level of hospital management or government

Conscientious Objection

Patients Refusing Treatment

- in accordance with the principle of autonomy, it is generally acceptable for competent patients to refuse medical interventions for themselves or others, although exceptions may occur
- if parents or SDMs make decisions that are clearly not in the “best interests” of an incapable child, physicians may have ethical grounds for administering treatment, depending on the acuity of the clinical situation
  - in high-acuity scenarios (e.g. refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child’s best interests
  - in lower acuity scenarios (e.g. refusing childhood immunization in a developed nation) there is a stronger obligation to respect the autonomy of the decision-makers
  - pursuing traditional First Nations healing (in conjunction or in the place of standard biomedical therapy) is legally considered a constitutionally protected right, which can be made by a SDM, as ruled in *Hamilton Health Sciences v. DH* in 2014

Physicians Refusing to Provide Treatment

- physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere (e.g. a pediatrician who refuses to treat an unvaccinated child should refer the family to another practice)

Aboriginal Legal and Health Policy

- Aboriginal peoples collectively refers to original inhabitants of Canada and their descendants: First Nations, Inuit, and Métis peoples defined in the Canadian Constitution Act, 1982
  - First Nations people encompasses most of geographic Canada and constitutes many distinct communities and languages.
  - Inuit peoples refers to original inhabitants of arctic regions including Labrador, northern Quebec, Nunavut, and Northwest Territories.
  - Métis are historic people of mixed First Nations and European heritage
  - *Canadian Indian Act*, 1976, defined who is considered a “status Indian” and thus eligible for programs and services by federal and provincial agencies. Non-Status First Nations, are Aboriginals who are not a “Registered Indian” with the federal government
  - the *Daniels Decision*, 2013 Federal Court of Canada, deemed Métis and non status be considered “Indians” under Canadian Constitution Act
- Aboriginal Health Policy in Canada is made up of a complicated “patchwork” of policies, legislation and agreements between federal, provincial, municipal, and Aboriginal governments which is in a constant state of flux; reviewed by the National Collaborating Centre for Aboriginal Health (NCCAH): http://www.nccah-ccnsa.ca/en/publications.aspx?sortcode=2.8.10&publication=28
  - while some Aboriginal health services are adequate, gaps and ambiguities created by complicated policy and jurisdictions have created barriers to health equity
  - for majority of Métis, off-reserve, and non-status Indians, health services are financed through the National Health Insurance plan administered at the provincial and territorial level
  - for on-reserve First Nations and Inuit, the federal government finances and administers health services through the First Nations and Inuit Health Branch (FNIIH)
  - the *Indian Health Policy*, 1979, and *Health Transfer Policy*, 1989, transferred control to individual communities to negotiate with the FNIIH varying levels of health care responsibility to the community or council level
  - treaties and Self Government Agreements define areas of jurisdiction for federal, provincial/territorial, and Aboriginal governments
  - in general, multiple levels of authority and responsibility are involved with the general tendency towards delegating responsibility to local levels

### Types of Anesthesia

- **general**
  - general anesthesia (GA)
  - total IV anesthesia (TIVA)

- **regional**
  - spinal, epidural
  - peripheral nerve block
  - IV regional

Note that different types of anesthesia can be combined (general + regional)

## Pre-Operative Assessment

### Purpose

- identify concerns for medical and surgical management of patient
- a low for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

### History and Physical

#### History

- age, gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, medications, drug allergies, post-operative N/V
- FHx: abnormal anesthetic reactions, malignant hyperthermia, pseudocholinesterase deficiency (see Uncommon Complications, A28)
Pre-Operative Assessment

PMHx
- CNS: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm
- CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS/NYHA class (Cardiology and Cardiac Surgery: C35 sidebar for NYHA Classification)
- respiratory: smoking, asthma, COPD, recent upper respiratory tract infection, sleep apnea
- GI: GERD, liver disease, NPO status
- renal: insufficiency, dialysis, chronic kidney disease
- hematologic: anemia, coagulopathies, blood dyscrasias
- MSK: conditions associated with difficult intubations – arthritides (e.g. rheumatoid arthritis), cervical tumours, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery, Trisomy 21, scleroderma, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
- endocrine: DM, thyroid disorders, adrenal disorders
- other: morbid obesity, pregnancy, ethanol/other drug use

Physical Exam
- weight, height, BP, pulse, respiratory rate, oxygen saturation
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment is done to determine intubation difficulty (no single test is specific or sensitive) and ventilation difficulty
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion ("sniffing position")
  - Mallampati classification
  - "3-2-1 rule”
    - thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
    - mouth opening (<2 finger breadths is associated with difficult intubation)
    - anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
- tongue size
- dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – pose aspiration risk if dislodged and must inform patients of rare possibility of damage
- nasal passage patency (if planning nasotracheal intubation)
- assess potential for difficult ventilation
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, central venous pressure (CVP), and pulmonary artery (PA) catheters

Figure 1. Mallampati classification of oral opening
Pre-Operative Investigations

- routine pre-operative investigations are only necessary if there are comorbidities or certain indications

Table 1. Suggested Indications for Specific Investigations in the Pre-Operative Period

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia

American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- ASA 1: a healthy, fit patient
  - e.g. controlled Type 2 DM, controlled essential HTN, obesity, smoker
- ASA 2: a patient with mild systemic disease
  - e.g. stable CAD, COPD, DM, obesity
- ASA 4: a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- ASA 5: a moribund patient not expected to survive 24 hr without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- ASA 6: declared brain dead, a patient whose organs are being removed for donation purposes
  - for emergency operations, add the letter E after classification (e.g. ASA 3E)

Pre-Operative Optimization

- in general, prior to elective surgery:
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood and these conditions should be optimized prior to surgery
  - medications may need adjustment

Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- pre-operative medications to consider
  - prophylaxis
    - risk of GE reflux: sodium citrate and/or ranitidine and/or metoclopramide 30 min-1 h prior to surgery
    - risk of infective endocarditis, GI/GU interventions: antibiotics
    - risk of adrenal suppression: steroid coverage
    - anxiety: consider benzodiazepines
    - COPD, asthma: bronchodilators
    - CAD risk factors: nitroglycerin and β-blockers
- pre-operative medications to stop
  - oral antihyperglycemics: stop on morning of surgery
  - ACEI and angiotension receptor blockers: stop the day before the surgery
• warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel), Xa inhibitor, direct thrombin inhibitors
• discuss perioperative use of ASA, NSAIDs with surgeon (+ patient’s cardiologist/internist)
• in patients undergoing non-cardiac surgery, starting or continuing low-dose aspirin in the perioperative period does not appear to protect against post-operative MI or death, but increases the risk of major bleeding
  – note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
• pre-operative medications to adjust
  • insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

### Hypertension

• BP <180/110 is not an independent risk factor for perioperative cardiovascular complications
• target SBP <180 mmHg, DBP <110 mmHg
• assess for end-organ damage and treat accordingly

### Coronary Artery Disease

• ACC/AHA Guidelines (2014) recommend that at least 60 days should elapse after a MI before a non-cardiac surgery in the absence of a coronary intervention
  • this period carries an increased risk of re-infarction/death
  • if operative procedure is essential and cannot be delayed then invasive intra- and post-operative ICU monitoring is required to reduce the above risk
  • mortality with perioperative MI is 20-50%
• perioperative β-blockers
  • may decrease cardiac events and mortality (controversial, as recent data suggests stroke risk)
  • continue β-blocker if patient is routinely taking it prior to surgery
  • consider initiation of β-blocker in:
    • patients with CAD or indication for β-blocker
    • intermediate or high risk surgery, especially vascular surgery

### Respiratory Diseases

• smoking
  • adverse effects: altered mucus secretion and clearance, decreased small airway calibre, altered oxygen carrying capacity, increased airway reactivity and altered immune response
  • abstain at least 8 wk pre-operatively if possible
  • if unable, abstaining even 24 h pre-operatively has been shown to increase oxygen availability to tissues
• asthma
  • pre-operative management depends on degree of baseline asthma control
  • increased risk of bronchospasm from intubation
  • administration of short course (up to 1 wk) pre-operative corticosteroids and inhaled β2-agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
  • avoid non-selective β-blockers due to risk of bronchospasm
  • cardioselective β-blockers (metoprolol, atenolol) do not increase risk of bronchospasm in the short-term
  • delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
  • delay elective surgery by a minimum of 6 wk if patient develops URTI
• COPD
  • anesthesia, surgery (especially abdominal surgery, in particular upper abdominal surgery) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
  • pre-operative ABG is needed for all COPD stage II and III patients to assess baseline respiratory acidosis and plan post-operative management of hypercapnea
  • cancel/delay elective surgery for acute exacerbation

### Aspiration

• increased risk of aspiration with:
  • decreased LOC
  • trauma
  • meals within 8 h
  • suspected sphincter incompetence (GERD, hiatus hernia, nasogastric tube)
  • increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
  • laryngeal mask vs. endotracheal tube (ETT)
• management
  • reduce gastric volume and acidity
  • delay inhibiting airway reflexes with muscular relaxants
  • employ rapid sequence induction (see Rapid Sequence Induction, A15)
Fasting Guidelines

Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists’ Society)

- 8 h after a meal that includes meat, fried or fatty foods
- 6 h after a light meal (such as toast or crackers) or after ingestion of infant formula or non-human milk
- 4 h after ingestion of breast milk
- 2 h after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)

Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit and coagulation profiles when indicated (see Table 1)
- anemia
  - pre-operative treatments to increase hemoglobin (P.O. or I.V. iron supplementation, erythropoietin or pre-admission blood collection in certain populations)
- coagulopathies
  - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA, apixaban, dabigatran) in advance of elective surgeries
  - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

Endocrine Disorders

- diabetes mellitus
  - clarify type 1 vs. type 2
  - clarify treatment – oral anti-hyperglycemics and/or insulin
  - assess glucose control with history and HbA1c; well controlled diabetics have more stable glucose levels intraoperatively
  - end organ damage: be aware of damage to cardiovascular, renal, and nervous systems, including autonomic neuropathy
  - formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
- hyperthyroidism and hypothyroidism
  - can experience sudden release of thyroid hormone (thyroid storm) if not treated or well-controlled pre operatively
  - treatment: β-blockers and pre-operative prophylaxis. Hypothyroidism - may result in myxedema coma, weakness
  - adrenocortical insufficiency (Addison’s, exogenous steroid use)
  - consider intraoperative steroid supplementation

Obesity and Obstructive Sleep Apnea

- assess for co-morbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- both obesity and OSA increase risk of difficult ventilation, intubation and post-operative respiratory complications
  - risk may be magnified with both diseases present

Monitoring

Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: “the only indispensable monitor”
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, O₂ saturation, End Tidal CO₂, dose and route of drugs and fluids
- continuous monitoring: see Routine Monitors for All Cases

Routine Monitors for All Cases

- pulse oximeter, BP monitor, electrocardiography and capnography are required for general anesthesia and sedation (Ramsey Sedation Scale 4-6), agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometer
Elements to Monitor

• anesthetic depth
  ■ inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating
  ■ excessive: hypotension, bradycardia
• oxygenation: pulse oximetry, fraction of inspired O2 (FiO2)
• ventilation: verify correct position of ETT, chest excursions, breath sounds, ETCO₂ analysis, end tidal inhaled anesthesia analysis
• circulation: pulse, rhythm, BP, telemetry, oximetry, CVP, pulmonary capillary wedge pressure
• temperature
• hourly urine output

Airway Management

Airway Anatomy

• resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
• pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
• glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
• the glottic opening is the space through which one visualizes proper placement of the ETT
• the trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

Methods of Supporting Airways

1. non-definitive airway (patent airway)
   ■ jaw thrust/chin lift
   ■ oropharyngeal and nasopharyngeal airway
   ■ bag mask ventilation
   ■ LMA
2. definitive airway (patent and protected airway)
   ■ ETT
   ■ surgical airway (cricothyrotomy or tracheostomy)
### Table 2. Methods of Supporting the Airway

### Tracheal Intubation

#### Preparing for Intubation
- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see Pre-Operative Assessment, A2)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O2 for 3-5 min or for 4-8 vital capacity breaths
- may need to suction mouth and pharynx first

#### Proper Positioning for Intubation
- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
  - ’sniffing position’: flexion of lower C-spine (C5 C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air
  - contraindicated in known/suspected C-spine fracture/instability
  - laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

---

© Jennifer Belanger 2009

© Derek Ng 2015

© Jennifer Belanger 2018
**Tube Insertion**

- Laryngoscopy and ETT insertion can incite a significant sympathetic response via stimulation of cranial nerves 9 and 10 due to a "foreign body reflex" in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing.
- A malpositioned ETT is a potential hazard for the intubated patient.

  - If too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax.
  - If too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff.
- The tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords.
- Approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women.

**Confirmation of Tracheal Placement of ETT**

- Direct
  - Visualization of ETT passing through cords.
  - Bronchoscopic visualization of ETT in trachea.
- Indirect
  - ETCO₂ in exhaled gas measured by capnography – a mandatory method for confirming the ETT is in the airway.
  - Auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium.
  - Bilateral chest movement, condensation of water vapour in ETT visible during exhalation and no abdominal distention.
  - Refilling of reservoir bag during exhalation.
  - CXR (rarely done): Only confirms position of the tip of ETT and not that ETT is in the trachea.
- Esophageal intubation suspected when:
  - ETCO₂ zero or near zero on capnograph.
  - Abnormal sounds during assisted ventilation.
  - Impairment of chest excursion.
  - Hypoxia/cyanosis.
  - Presence of gastric contents in ETT.
  - Breath sounds heard when auscultating over epigastrium/LUQ.
  - Distention of stomach/epigastrium with ventilation.

**Complications During Laryngoscopy and Intubation**

- Dental damage.
- Laceration (lips, gums, tongue, pharynx, vallecula, esophagus).
- Laryngeal trauma.
- Esophageal or endobronchial intubation.
- Accidental extubation.
- Insufficient cuff inflation or cuff laceration: results in leaking and aspiration.
- Laryngospasm (see Extubation, A20, for definition).
- Bronchospasm.

**Difficult Airway**

- Difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway or surgical airway.
- Pre-operative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures.
- If difficult airway expected, consider:
  - Awake intubation.
  - Intubating with bronchoscope, trachlight (lighted stylet), fibre optic laryngoscope, glidescope, etc.
- If intubation unsuccessful after induction:
  1. Call for help.
  2. Ventilating with 100% O₂ via bag and mask.
  3. Consider returning to spontaneous ventilation and/or waking patient.
- If bag and mask ventilation inadequate:
  1. Call for help.
  2. Attempt ventilation with oral airway.
  3. Consider/attempts LMA.
  4. Emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy, or tracheostomy).

---

**Difficult Airway**

- **Predicting Difficult Intubation in Apparently Normal Patients**

  - **Meta-analysis.**
  - **Purpose:** To assess widely available bedside tests and widely used laryngoscopic techniques in the prediction of difficult intubations.
  - **Patients:** 35 studies encompassing 50,760 patients.
  - **Definitions:** Difficult intubation was defined usually as Cormack–Lehane grade of 3 or greater, but some authors reported the requirement of a special technique, multiple unsuccessful attempts, or a combination of these as the accepted standard for difficult intubation.
  - **Results:** The overall incidence of difficult intubation was 5.8% (95% CI 4.5–7.5%) for the overall patient population, 6.2% (95% CI 4.6–8.3%) for normal patients excluding obstetric and obese patients, 3.1% (95% CI 1.7–5.5%) for obstetric patients, and 15.8% (95% CI 14.3–17.5%) for obese patients.
  - **Mallampati score:** SN: 49% SP: 86% PLR: 3.7 NLR: 0.5, thyromental distance: SN: 20% SP: 94% PLR: 3.4 NLR: 0.8, sternomental distance: SN: 62% SP: 82% PLR: 7.7 NLR: 0.5, mouth opening: SN: 22% SP: 97% PLR: 4.0 NLR: 0.3, Wilson risk-sum: SN: 48% SP: 99% PLR: 9.8 NLR: 0.6; combination: SN: 98% SP: 87% PLR: 9 NLR: 0.6.
  - **Conclusions:** A combination of the Mallampati score and thyromental distance is the most accurate at predicting difficult intubation. The PLR (9.9) is supportive of the test as a good predictor of difficult intubation.

  - **PLR:** positive likelihood ratio; **NLR:** negative likelihood ratio; **SN:** sensitivity; **SP:** specificity.
Oxygen Therapy

- in general, the goal of oxygen therapy is to maintain arterial oxygen saturation ($\text{SaO}_2$) $>90\%$
- small decrease in saturation below $\text{SaO}_2$ of 90% corresponds to a large drop in arterial partial pressure of oxygen ($\text{PaO}_2$)
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements (FiO2) and the degree to which precise control of delivery is needed
- cyanosis can be detected at $\text{SaO}_2 <85\%$, frank cyanosis at $\text{SaO}_2 = 67\%$

Low Flow Systems

- provide $\text{O}_2$ at flows between 0-10 L/min
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) $<25$, consistent ventilation pattern
- dilution of oxygen with room air results in a decrease in FiO2
- an increase in minute ventilation (tidal volume x RR) results in a decrease in FiO2
  - e.g. nasal cannula (prongs)
    - well tolerated if flow rates $<5-6$ L/min; drying of nasal mucosa at higher flows
    - nasopharynx acts as an anatomic reservoir that collects $\text{O}_2$
    - delivered oxygen concentration (FiO2) can be estimated by adding 4% for every additional litre of $\text{O}_2$ delivered
    - provides FiO2 of 24-44% at $\text{O}_2$ flow rates of 1-6 L/min

Reservoir Systems

- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask
  - covers patient’s nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore O2 tubing at a rate of at least 6 L/min to ensure that exhaled CO2 is flushed through the exhalation ports and not rebreathed
  - provides FiO2 of 55% at $\text{O}_2$ flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
  - during the exhalation phase, the bag accumulates with oxygen
  - provides FiO2 of 80% at $\text{O}_2$ flow rates of 10-15 L/min

High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient’s inspiratory flow requirement
- deliver consistent and predictable concentration of $\text{O}_2$
- Venturi mask
  - delivers specific FiO2 by varying the size of air entrapment
  - oxygen concentration determined by mask’s port and NOT the wall flow rate
  - enables control of gas humidity
  - FiO2 ranges from 24-50%

Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

Mechanical Ventilation

- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver positive end expiratory pressure (PEEP)
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - tracheal stenosis, laryngeal edema
  - alveolar complications
    - ventilator-induced lung injury (barotrauma, volutrauma atelectrauma), ventilator-associated pneumonia (nosocomial pneumonia), inflammation, auto PEEP, patient-ventilator asynchrony
  - cardiovascular complications
    - reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension

Positive End Expiratory Pressure (PEEP)

- Positive pressure applied at the end of ventilation that helps to keep alveoli open, decreasing V/Q mismatch
- Used with all invasive modes of ventilation

Tracheostomy

- Tracheostomy should be considered in patients who require ventilator support for extended periods of time
- Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities
- neuromuscular complications
- muscle atrophy
- increased intracranial pressure
- metabolic
  - decreased CO₂ due to hyperventilation
- alkalemia with over correction of chronic hypercarbia

### Ventilator Strategies
- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

### Modes of Ventilation
- assist-control ventilation (ACV) or volume control (VC)
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a preset constant inspiratory pressure
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure depending on whether in VC or PCV, respectively)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and pediatric respiratory failure
  - occasionally used in adults when conventional mechanical ventilation is failing
- non-invasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask
  - BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration (i.e. PEEP)
  - CPAP: delivers constant pressure on both inspiration and expiration

### Toronto Notes 2018

- Monitoring Ventilatory Therapy
  - Pulse oximetry, end-tidal CO₂ concentration
  - Regular arterial blood gases
  - Assess tolerance regularly

- Patients who develop a pneumothorax while on mechanical ventilation require a chest tube

- Causes of Intraoperative Hypoxemia
  - Inadequate oxygen supply e.g. breathing system disconnection, obs ructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply
  - Hypoventilation
  - Ventilation-perfusion inequalities e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax
  - Reduction in oxygen carrying capacity e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy
  - Leftward shift of the hemoglobin-oxygen saturation curve e.g. hypothermia, decreased 2,3-BPG, alkalosis, hypocarbia, carbon monoxide poisoning

- Right-to-left cardiac shunt

---

### A Comparison of Four Methods of Weaning Patients from Mechanical Ventilation

**NEJM** 1995;332:345-350

**Study:** Prospective, randomized, multicentre trial.

**Participants:** 130 of 546 patients who received mechanical ventilation and were considered ready for weaning but had respiratory distress during a 2 h trial of spontaneous breathing.

**Intervention:** One of four weaning techniques following standardized protocol.

**Outcome:** Median duration of weaning.

**Results:** The median duration of weaning for intermittent mandatory ventilation, pressure-support ventilation, intermittent (multiple) trials of spontaneous breathing, and once-daily trial of spontaneous breathing was 5 d, 4 d, and 3 d, respectively. The rate of successful weaning was higher with once-daily trial of spontaneous breathing than with intermittent mandatory ventilation (rate ratio 2.83; 95% CI 1.36-5.89; p<0.006) or pressure-support ventilation (ratio 2.05; 95% CI 1.04-4.04; p<0.04). There was no significant difference in the rate of success between once-daily trials and multiple trials of spontaneous breathing.

**Conclusions:** Once-daily or multiple trials of spontaneous breathing led to extubation more quickly than intermittent mandatory or pressure-support ventilation.

---
Intraoperative Management

Temperature

Causes of Hypothermia (<36.0°C)
Intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to:
- OR environment (cold room, IV fluids, instruments)
- open wound
- prevent with forced air warming blanket and warmed IV fluids

Causes of Hyperthermia (>37.5-38.3°C)
- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see Uncommon Complications, A28)
- over-zealous warming efforts

Heart Rate

Cardiac Arrest
- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclusion of all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hyp/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
- when a patient sustains a cardiac arrest during anesthesia, it is important to remember that there are other causes on top the Hs and Ts to consider (i.e. local anesthetic systemic toxicity (LAST), excessive anesthetic dosing and others)
- for management of cardiac arrest, see ACLS Guidelines (Figure 16), A31

Intraoperative Tachycardia
- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
- SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
- wide complex tachycardia: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia
  - febrile illness/sepsis
  - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium) and withdrawal
  - Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see ACLS Guidelines (Figure 17), A32

Intraoperative Bradycardia
- bradycardia = HR <50 bpm; most concerning are 2nd degree (Mobitz type II) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see Cardiology and Cardiac Surgery, C16)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. Sch, opioids, edrophonium, neostigmine, halothane, digoxin, β-blockers)
  - high spinal/epidural anesthesia
- for management of bradycardia, see ACLS Guidelines (Figure 18), A32

Impact of Hypothermia (<36°C)
- increased risk of wound infections due to impaired immune function
- increases the period of hospitalization by delaying healing
- reduces platelet function and impairs activation of coagulation cascade increasing blood loss and transfusion requirements
- triples the incidence of VT and morbidity cardiac events
- decreases the metabolism of anesthetic agents prolonging post-operative recovery
Blood Pressure

Causes of Intraoperative Hypotension/Shock

- shock condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of oxygen to tissues
  a) hypovolemic/hemorrhagic shock
     - most common form of shock, due to decrease in intravascular volume
  b) obstructive shock
     - obstruction of blood into or out of the heart
     - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
     - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism (and other emboli – i.e. fat, air)
  c) cardiogenic shock
     - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
     - e.g. myocardial dysfunction, dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
  d) septic shock
     - see Infectious Diseases, ID21
  e) spinal/neurogenic shock
     - decreased sympathetic tone
     - hypotension without tachycardia or peripheral vasoconstriction (warm skin)
  f) anaphylactic shock
     - see Emergency Medicine, ER28
  g) drugs
     - vasodilators, high spinal anesthetic interfering with sympathetic outflow
  h) other
     - transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
     - see Hematology, H52 and Endocrinology, E33

Causes of Intraoperative Hypertension

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine) and withdrawal
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome (see Psychiatry, PS46), thyroid storm, pheochromocytoma (see Endocrinology, E25)

Fluid Balance and Resuscitation

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings this formula must take into account multiple factors including pre-operative fasting/decreased fluid intake, increased losses during or before surgery, fluid shifting during surgery, fluids given with blood products and medications

What is the Maintenance?

- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
  - 4:2:1 rule to calculate maintenance requirements (applies to crystalloids only)
    - 4 mL/kg/h first 10 kg
    - 2 mL/kg/h second 10 kg
    - 1 mL/kg/h for remaining weight >20 kg
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - Na\(^+\): 3 mEq/kg/d
  - K\(^+\): 1 mEq/kg/d
- 50 kg patient maintenance requirements
  - fluid = 40 + 20 + 30 = 90 mL/h = 2160 mL/d = 2.16 L/d
  - Na\(^+\) = 150 mEq/d (therefore 150 mEq / 2.16 L/d = 69 mEq/L)
  - K\(^+\) = 50 mEq/d (therefore 50 mEq / 2.16 L/d = 23 mEq/L)
- above patients requirements roughly met with 2/3 D5W, 1/3 NS
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre
What is the Deficit?
- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na⁺ content determines ECF volume, [Na⁺] determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal Na⁺ loss
    - GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - skin/respiratory: insensible losses (fever), sweating, burns
    - vascular: hemorrhage
    - renal Na⁺ and H₂O loss
    - diuretics
    - osmotic diuresis
    - hypoaldosteronism
    - salt-wasting nephropathies
    - renal H₂O loss
    - diabetes insipidus (central or nephrogenic)
  - hypovolemia with normal or expanded ECF volume
  - decreased CO
  - redistribution
    - hypovolemic: cirrhosis, nephrotic syndrome
    - capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
  - replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

Table 4. Signs and Symptoms of Dehydration

<td>Profound oliguria or anuria and compromised CNS function with or without altered sensorium</td>
</tr>
</tbody>
</table>

What are the Ongoing Losses?
- losses from Foley catheter, NG, surgical drains
- third-spacing (other than ECF, ICF)
  - pleura, GI, retroperitoneal, peritoneal
  - evaporation via exposed viscera, burns
- blood loss
- ongoing loss due to surgical exposure and evaporative losses

IV Fluids
- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O₂ carrying capacity of blood

Initial Distribution of IV Fluids
- H₂O follows ions/molecules to their respective compartments

Crystalloid Infusion
- salt containing solutions that distribute only within ECF
- maintain euvolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- if large volumes are to be given, use balanced fluids such as Ringer’s lactate or Plasmalyte®, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

Colloid Infusion (see Blood Products, Hematology, H52)
- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextran and starches e.g. hydroxethyl starch [HES])
- distributes within intravascular volume
- 1:1 ratio (infusion:blood loss) only in terms of replacing intravascular volume
- the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
- colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

### Induction

#### Routine Induction vs. Rapid Sequence Induction

- Routine induction is the standard in general anesthesia, however a RSI is indicated in patients at risk of regurgitation/aspiration (see Aspiration, A5)
- RSI uses pre-determined doses of induction drugs given in rapid succession to minimize the time patient is at risk for aspiration (i.e. from the time when they are asleep without an ETT until the time when the ETT is in and the cuff inflated)

#### Table 7. Comparison of Routine Induction vs. RSI

</tbody>
</table>

#### Calculating Acceptable Blood Losses (ABL)

- Blood volume
  - term infant 80 mL/kg
  - adult male 70 mL/kg
  - adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion, (e.g. 70 g/L for a person with Hb(i) = 150 g/L)
- Hb(i) = 70 g/L
- Calculate
  \[ ABL = \frac{Hb(i) - Hb(f)}{EBV} \]
  \[ = \frac{150 - 70}{4900} \]
  \[ = 2613 mL \]
- Therefore in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

#### Transfusion Infection Risks

Induction Agents

- induction in general anesthesia may be achieved with intravenous agents, volatile inhalation agents, or both

Intravenous Agents
- see Table 8
- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with minimal adverse effects
- examples include propofol, sodium thiopental (not available in North America), or ketamine
- a continuous propofol infusion may also be used for the maintenance phase of GA

Table 8. Intravenous Induction Agents

*Properties and Adverse Effects of N2O

Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only.

Second Gas Effect

Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ET cuff will markedly enlarge if N2O is administered. Diffusion hypoxia: during anesthesia, the washout of N2O from body stores into alveoli can dilute the alveolar O2, creating a hypoxic mixture if the original O2 is low.

**Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis).

MAC (Minimum Alveolar Concentration)

- The alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision).
- Potency of inhalational agents is compared using MAC.
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population.
- MAC values are roughly additive when mixing N2O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N2O = 1 MAC of potent agent).
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC.
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC.
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, generally 0.3-0.4 of the usual MAC.

**Muscle Relaxants and Reversing Agents**

![Figure 8: Review of anatomy and physiology of the neuromuscular junction (NMJ)](image)}
Muscle Relaxants

- Two types of muscle relaxants: succinylcholine (SCh)
  1. Depolarizing muscle relaxants: succinylcholine (SCh)
  2. Non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cistronicum, pancuronium
- Block nicotinic cholinergic receptors in NMJ
- Provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- Never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation

Muscle relaxation produces the following desired effects:
  1. Facilitates intubation
  2. Assists with mechanical ventilation
  3. Prevents muscle stretch reflex and decreases muscle tone
  4. Allows access to the surgical field (intracavitary surgery)

Nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade

See Tables 10 and 11, for more details including mechanism of action

Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)

<table>
<thead>
<tr>
<th>Mechanism of Action</th>
<th>Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh</th>
</tr>
</thead>

</table>

Contraindications

Absolute
- Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenital), high risk for hyperkalemic response

Relative
- Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

Plasma Cholinesterase

Plasma cholinesterase is produced by the liver and metabolizes SCh, ester local anesthetics, and mivacurium. A prolonged duration of blockade by SCh occurs with:
(a) Decreased quantity of plasma cholinesterase, e.g. liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism
(b) Abnormal quality of plasma cholinesterase, e.g. normal levels but impaired activity of enzymes, genetically inherited

Side Effects

- **Histamine Release**: Yes, No, No, No, No
- **Other**: —, —, —, —, Tachycardia
- **Cons derations**: Increased duration of action in renal or liver failure, Quick onset of rocuronium allows its use in rapid sequence induction, Cisatracurium is good for patients with renal or hepatic insufficiency, Pancuronium if increased HR and BP desired

Reversing Agents

- sugammadex is a selective relaxant binding agent
- neostigmine, pyridostigmine, edrophonium are acetylcholinesterase inhibitors
- administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
- can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation, increased peristalsis and bronchoconstriction)

*Atropine and glycopyrrolate are anticholinergic agents administered during the administration of reversal agents to minimize muscarinic effects

Analgesia

- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDS, acetaminophen, ketamine, gabapentin, local, and regional anesthetic (see Table 15, A25)
Maintenance

- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids) and muscle relaxants are also given as needed

Extubation

- criteria: patient must no longer have intubation requirements
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O₂ for 3-5 min
  - suction secretions from pharynx, deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O₂ delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

Complications of Extubation

- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: apply sustained positive pressure with bag-mask ventilation with 100% oxygen, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (approximately 0.25 mg/kg) and reintubation if hypoxia develops

Regional Anesthesia

- local anesthetic agent (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

Patient Preparation

- sedation may be indicated before block
- monitoring should be as extensive as for general anesthesia

Epidural and Spinal Anesthesia

- most useful for surgeries performed below level of umbilicus

Anatomy of Spinal/Epidural Area

- spinal cord extends to L2, dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated (outside to inside)
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

Benefits of Regional Anesthesia

- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Reduced perioperative blood loss
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE
- Shorter recovery and improved rehabilitation
- Pain blockade with preserved motor function

Landmarking Epidural/Spinal Anesthesia

- Spinal processes should be maximally flexed
- L₄ spinous processes found between iliac crests
- T₇ landmark at the tip of the scapula

Classic Presentation of Dural Puncture Headache

- Onset 6 h-3 d after dural puncture
- Postural component (worse when sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia
Table 13. Epidural vs. Spinal Anesthesia

</thead>
<tbody>
<tr>
<td><strong>Deposition Site</strong></td>
<td>LA injected in epidural space (space between ligamentum flavum and dura) Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura</td>
<td>LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots</td>
</tr>
<tr>
<td><strong>Onset</strong></td>
<td>Significant blockade requires 10-15 min; slower onset of side effects</td>
<td>Rapid blockade (onset in 2-5 min)</td>
</tr>
<tr>
<td><strong>Effectiveness</strong></td>
<td>Effectiveness of blockade can be variable</td>
<td>Very effective blockade</td>
</tr>
<tr>
<td><strong>Difficulty</strong></td>
<td>Technically more difficult; greater failure rate</td>
<td>Easier to perform due to visual confirmation of CSF flow</td>
</tr>
<tr>
<td><strong>Patient Positioning</strong></td>
<td>Position of patient not as important; specific gravity not an issue</td>
<td>Hyperbaric LA solution – position of patient important</td>
</tr>
<tr>
<td><strong>Specific Gravity/ Spread</strong></td>
<td>Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread</td>
<td>LA solution may be made hyperbaric (of greater specific gravity than the cerebrospinal fluid by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)</td>
</tr>
<tr>
<td><strong>Dosage</strong></td>
<td>Larger volume/dose of LA (usually &gt; toxic IV dose)</td>
<td>Smaller dose of LA required (usually &lt; toxic IV dose)</td>
</tr>
<tr>
<td><strong>Continuous Infusion</strong></td>
<td>Use of catheter allows for continuous infusion or repeat injections</td>
<td>None</td>
</tr>
<tr>
<td><strong>Complications</strong></td>
<td>Failure of technique, Hypotension, Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. “high spinal” Epidural or subarachnoid hematoma Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications) Systemic toxicity of LA (accidental intravenous) Catheter complications (shearing, kinking, vascular or subarachnoid placement) Infection Dural puncture</td>
<td>Failure of technique, Hypotension, Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. “high spinal” Epidural or subarachnoid hematoma Post-spinal headache (CSF leak) Transient paresthesias Spinal cord trauma, infection</td>
</tr>
<tr>
<td><strong>Combined Spinal- Epidural</strong></td>
<td>Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter</td>
<td></td>
</tr>
</tbody>
</table>

Contraindications to Spinal/Epidural Anesthesia

- **absolute contraindications**
  - lack of resuscitative drugs/equipment
  - patient refusal
  - allergy to local anesthetic
  - infection at puncture site or underlying tissues
  - coagulopathies/bleeding diathesis
  - raised ICP
  - sepsis/bacteremia
  - severe hypovolemia
  - cardiac lesion with fixed output states (severe mitral/aortic stenosis)
  - lack of IV access
- **relative contraindications**
  - pre-existing neurological disease (demyelinating lesions)
  - previous spinal surgery, severe spinal deformity
  - prolonged surgery
  - major blood loss or maneuvers that can compromise reaction
Peripheral Nerve Blocks

- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- most major nerves or nerve plexi can be targeted (brachial plexus block, femoral nerve block, sciatic nerve block, etc.)
- performed with standard monitors
- approximately 2-4 per 10,000 risk of late neurologic injury
- resuscitation equipment must be available

Contraindications to Peripheral Nerve Blockade

- absolute contraindications
  - allergy to LA
  - patient refusal
- relative contraindications
  - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - local infection at block site
  - bleeding disorder

Local Anesthesia

Local Anesthetic Agents

- see Table 14, for list of LA agents

Definition and Mode of Action

- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptor on the cytosolic side of the Na+ channel, inhibiting Na+ flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

Absorption, Distribution, Metabolism

- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

Selection of LA

- choice of LA depends on:
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
  - potential for toxicity

Systemic Toxicity

- see Table 16, A25 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption

CNS Effects
- CNS effects first appear to be excitatory due to initial block of inhibitory fibres, then subsequent block of excitatory fibres
- effects in order of appearance
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus
  - visual disturbances
  - muscle twitching, tremors
  - unconsciousness
  - convulsions, seizures
  - generalized CNS depression, coma, respiratory arrest

CVS Effects
- vasodilation, hypotension
- decreased myocardial contractility
- dose-dependent delay in cardiac impulse transmission
  - prolonged PR, QRS intervals
  - sinus bradycardia
- CVS collapse

Treatment of Systemic Toxicity
- early recognition of signs, get help
- 100% O2, manage ABCs
- diazepam
- manage arrhythmias (see ACLS Guidelines, A32)
- Intralipid® 20% to bind local anesthetic in circulation

Local Infiltration and Hematoma Blocks

Local Infiltration
- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000-1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

Fracture Hematoma Block
- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

Topical Anesthetics
- various preparations of local anesthetics available for topical use, may be a mixture of agents (EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

Post-Operative Care
- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home

Common Post-Operative Anesthetic Complications

Uncontrolled/Poorly Controlled Pain

Nausea and Vomiting
- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), metoclopramide (Maxeran®; not with bowel obstruction)
  - prochlorperazine (Stemetil®), ondansetron (Zofran®) granisetron (Kytril®)
Confusion and Agitation
- ABCs first: confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (stroke, raised intracranial pressure)
- drug effect (ketamine, anticholinergics, serotonin)
- elderly patients are more susceptible to post-operative delirium

Respiratory Complications
- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

Hypotension
- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation (residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

Hypertension
- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
- sodium nitroprusside or β-blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

Pain Management

Definitions
- pain: perception of nociception, which occurs in the brain
- nociception: detection, transduction, and transmission of noxious stimuli

Pain Classifications
- temporal: acute vs. chronic
- mechanism: nociceptive vs. neuropathic

Acute Pain
- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

Figure 11. Acute pain mechanism

Figure 12. WHO analgesia ladder
Pharmacological Management of Acute Pain

- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity
- pharmacological treatment guided by WHO analgesia ladder
- patient controlled analgesia (PCA)
  - involves the use of computerized pumps that can deliver a constant infusion and bolus breakthrough doses of parenterally-administered opioid analgesics
  - limited by lockout intervals
  - most commonly used agents: morphine and hydromorphone
- see Table 17, A26 for suggested infusion rate, PCA dose and lockout intervals

Opioid Antagonists (naloxone, naltrexone)
- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly µ receptors
  - naloxone is short-acting (t1/2 = 1 h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - naltrexone is longer-acting (t1/2 = 10 h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, hypertension, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

Neuropathic Pain

- see Neurology, N41

Chronic Pain

- chronic pain: greater than 3 mo, or recurrent pain that occurs at least 3 times throughout three month period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
  - in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia and non-pharmacological techniques

Obstetrical Anesthesia

Anesthesia Considerations in Pregnancy

- airway
  - possible difficult airway as tissues becomes edematous and friable especially in labour
- respiratory
  - decreased FRC and increased O2 consumption cause more rapid desaturation during apnea
- cardiovascular system
  - increased blood volume > increased RBC mass results in mild anaemia
  - decreased SVR proportionately greater than increased CO results in decreased BP
  - prone to decreased BP due to aortocaval compression – therefore for surgery, a pregnant patient is positioned in left uterine displacement using a wedge under her right flank
- central nervous system
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- gastrointestinal system
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
  - combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

Options for Analgesia during Labour

- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object
- systemic medication
  - easy to administer, but risk of maternal or neonatal respiratory depression
  - opioids most commonly used if delivery is not expected within 4 h
- inhalational analgesia
  - easy to administer makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

Epidural vs. Non-Epidural or No Analgesia in Labour

Cochrane Database Syst Rev 2011;(12):CD000331

Purpose: To assess all modalities of epidural analgesia (including combined-spinal-epidural) versus non-epidural analgesia and no analgesia during labour in terms of maternal and neonatal outcomes.

Methods: Systematic review of randomized controlled trials comparing all modalities of epidural analgesia to any form of pain relief not involving regional blockade, or no pain relief. The Cochrane Pregnancy and Childbirth Group’s Trials Register was searched up to end March 2011. Primary analysis was by intention to treat.

Results: 38 studies involving 9658 women were included; 33 studies compared epidural analgesia with opiates. Epidural analgesia was associated with better pain relief (risk ratio (RR) 0.05, 95%, CI 0.02 to 0.17), reduced risk of admission (RR 0.017, 0.01 to 0.04), and reduced risk of naloxone administration (RR 0.015, 0.10 to 0.23), but was also associated with increased risk of assisted vaginal birth (RR 1.42, 1.28 to 1.57), maternal hypotension (RR 1.19, 1.03 to 1.39) and caesarean section for fetal distress (RR 1.43, 1.03 to 1.97). No significant differences were found in terms of overall risk of caesarean section (RR 1.0, 0.97 to 1.03), long-term backache (RR 0.98, 0.88 to 1.07), Apgar score less than seven at five minutes (RR 0.80, 0.68 to 1.00), and maternal satisfaction with pain relief (RR 1.31, 0.94 to 1.85).

Conclusions: While epidural analgesia appears effective for pain control during labour, it places women at an increased risk of an instrumental delivery, and is not associated with significant differences in C-section risk, maternal pain relief satisfaction long-term back ache or Apgar scores.

Nociceptive Pathways in Labour and Delivery

Labour

- Cervical dilation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1

Delivery

- Distension of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4
Options for Caesarean Section
- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade

Pediatric Anesthesia

Respiratory System
- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U shaped and angled at 45°; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include:
  - faster RR, immature respiratory centres which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
  - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

Cardiovascular System
- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia severe compromise in CO

Temperature Regulation
- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant’s head, humidification of inspired gases, and warming of infused solutions

Central Nervous System
- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetic at 4-6 mo thus autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

Glucose Maintenance
- infants <1 yr can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

Pharmacology
- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB
- muscle relaxants
  - non-depolarizing
    - immature NMJ, variable response
  - depolarizing
    - must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm and malignant hyperthermia

To increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume.
Neonate: 30-40 breaths/min
Age 1-13: (24 – [age/2]) breaths/min

ETT Sizing in Pediatrics
Diameter (mm) of tracheal tube in children
after 1 year = (age/4) + 4
Length (cm) of tracheal tube = (age/2) + 12
Uncommon Complications

Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular Ca\(^{2+}\) (because of an anomaly of the ryanodine receptor which regulates Ca\(^{2+}\) channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100,000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include:
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

Clinical Picture

- onset: immediate or hours after contact with trigger agent
- increased oxygen consumption
- increased ETCO\(_2\) on capnograph
- tachycardia/dysrhythmia
- tachypnea/cyanosis
- diaphoresis
- hypertension
- increased temperature (late sign)
- muscular symptoms
  - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and ETCO\(_2\) monitoring

Malignant Hyperthermia Management
(Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008)

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
   - repeat until there is control of signs of MH; up to 30 mg/kg as necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature >39°C
   - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
   - stop cooling if temperature is <38°C to prevent drift to <36°C
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
   - use standard drug therapy except Ca\(^{2+}\) channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene
6. hyperkalemia
   - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
   - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow ETCO\(_2\), electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
   - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce diuresis to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

Signs of Malignant Hyperthermia

- Unexplained rise in ETCO\(_2\)
- Increase in minute ventilation
- Tachycardia
- Rigidity
- Hyperthermia (late sign)

Basic Principles of MH Management

“Some Hot Dude Better Get Iced Fluids Fast”
Stop all triggering agents, give 100% O\(_2\)

Hyperventilate
Dantrolene 2.5 mg/kg every 5 min
Bicarbonate
Glucose and insulin
IV fluids; cool patient to 38°C
Fluid output; consider furosemide
Tachycardia: be prepared to treat VT
Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors rebound neuromuscular blockade once drug effect is terminated)

### Advanced Cardiac Life Support Guidelines

**Figure 16. Adult cardiac arrest algorithm**

### Adult Tachycardia (With Pulse)

1. **Assess appropriateness for clinical condition**
   - Heart rate typically ≥150/min if tachyarrhythmia

2. **Identify and treat underlying cause**
   - Maintain patent airway; assist breathing as necessary
   - Oxygen (if hypoxemic)
   - Cardiac monitor to identify rhythm; monitor blood pressure and oximetry

3. **Persistent tachyarrhythmia causing:**
   - Hypotension?
   - Acutely altered mental status?
   - Signs of shock?
   - Ischemic chest discomfort?
   - Acute heart failure?

4. **Synchronized cardioversion**
   - Consider sedation
   - If regular narrow complex, consider adenosine
   - IV access and 12-lead ECG if available
   - Consider adenosine only if regular and monomorphic
   - Consider antiarrhythmic infusion
   - Consider expert consultation

5. **Wide QRS? ≥0.12 second**
   - Yes
     - IV access and 12-lead ECG if available
     - Consider adenosine only if regular and monomorphic
     - Consider antiarrhythmic infusion
     - Consider expert consultation
   - No

6. **Doses/Details**
   - **Synchronized Cardoversion**
     - Initial recommended doses:
       - Narrow regular: 50-100 J
       - Narrow irregular: 120-200 J biphasic or 200 J monophasic
       - Wd de regular: 100 J
       - Wide irregular: defibrillation dose (NOT synchronized)

   - **Adenosine IV Dose:**
     - First dose: 6 mg rapid IV push; follow with NS flush
     - Second dose: 12 mg if required

   - **Antiarrhythmic Infusions for Stable Wide-QRS Tachycardia**
     - Procainamide IV Dose:
       - 20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases >50%, or maximum dose 17 mg/kg given
       - Maintenance infusion: 1-4 mg/min Avoid if prolonged QT or CHF

   - **Amiodarone IV Dose:**
     - First dose: 150 mg over 10 min
     - Repeat as needed if VT recurs
     - Follow by maintenance infusion of 1 mg/min for first 6 h

   - **Sotalol IV Dose:**
     - 100 mg (1.5 mg/kg) over 5 min
     - Avoid if prolonged QT

### Adult Bradycardia (With Pulse)

1. **Assess appropriateness for clinical condition**
   - Heart rate typically <50/min if bradyarrhythmia

2. **Identify and treat underlying cause**
   - Maintain patent airway; assist breathing as necessary
   - Oxygen (if hypoxemic)
   - Cardiac monitor to identify rhythm; monitor blood pressure and oximetry
   - IV access
   - 12-Lead ECG if available; do not delay therapy

3. **Persistent bradyarrhythmia causing:**
   - Hypotension?
   - Acutely altered mental status?
   - Signs of shock?
   - Ischemic chest discomfort?
   - Acute heart failure?

4. **Monitor and observe**
   - Yes
   - No

5. **Atropine**
   - If atropine ineffective:
     - Transcutaneous pacing OR
     - Dopamine infusion OR
     - Epinephrine infusion

6. **Consider:**
   - Expert consultation
   - Transvenous pacing

### Basic Anatomy Review

#### Coronary Circulation

- Conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta.
  - Right coronary artery (RCA):
    - Acute marginal branches
    - Atrioventricular (AV) nodal artery
    - Posterior interventricular artery (PIV) = posterior descending artery (PDA)
  - Left main coronary artery (LCA):
    - Left anterior descending artery (LAD)
      - Septal branches
      - Diagonal branches
    - Left circumflex artery (LCx)
      - Obtuse marginal branches
  - Dominance of circulation:
    - Right-dominant circulation: PIV and at least one posterolateral branch arise from RCA (80%)
    - Left-dominant circulation: PIV and at least one posterolateral branch arise from LCx (15%)
    - Balanced circulation: dual supply of posteroinfarction LV from RCA and LCx (5%)
  - The sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCx (40%)
  - Most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through thebesian veins into all four chambers, contributing to the physiologic R-L shunt

![Image: Anatomy of the coronary arteries (right anterior oblique projection)](image-url)

**Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)**
Cardiac Anatomy

- layers of the heart
  - endocardium, myocardium, epicardium, visceral pericardium, pericardial cavity, parietal pericardium

- valves
  - semilunar valves:
    - aortic valve, 3 valve leaflets: separates LV and ascending aorta
    - pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
    - tricuspid valve, 3 valve leaflets: separates RA and RV
    - mitral/bicuspid valve, 2 valve leaflets: separates LA and LV

- conduction system
  - SA node governs pacemaking control
  - anterior-, middle-, and posterior-internal nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
  - atrial impulses converge at the AV node
    - the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosis (except when accessory pathways are present)
  - the bundle of His bifurcates into left and right bundle branches (LBB and RBB)
  - LBB further splits into anterior and posterior fascicles
  - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

Legend:
- AV – aortic valve
- LA – left atrium
- LV – left ventricle
- MV – mitral valve

Features of Abnormal JVP Wave Formation
- Atrial fibrillation: absent a wave
- 3rd degree heart block: cannon a waves
- Tricuspid regurgitation: c' wave, elevated JVP
- Cardiac tamponade: x descent only, absent y descent
- Constrictive pericarditis: prominent y descent, Kussmaul's sign
  (paradoxical increase in JVP with inspiration)
• cardiovascular innervation
  • sympathetic nerves
    • innervate the SA node, AV node, ventricular myocardium and vasculature
    • SA node (β1) fibres increase pacemaking activity (chronotropy - HR)
    • cardiac muscle (β1) fibres increase contractility (inotropy - SV)
    • stimulation of β1- and β2-receptors in the skeletal and coronary circulation causes vasodilatation
  • parasympathetic nerves
    • innervate the SA node, AV node, atrial myocardium but few vascular beds
    • basal vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node resulting in slowing of pacemaker activity and conduction (i.e. reduced dromotropy – if only affecting AV node conduction)
    • parasympathetics have very little impact on total peripheral vascular resistance

Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, *underlined* text indicates life threatening condition

### Chest Pain

- **cardiac**
  - MI/angina, myocarditis, pericarditis/Dressler’s syndrome
- **pulmonary**
  - PE, pneumothorax/hemothorax, tension pneumothorax, pneumonia, empyema, pulmonary neoplasm, bronchiectasis, TB
- **gastrointestinal**
  - esophageal: GERD, esophageal rupture, spasm, esophagitis, ulceration, achalasia, neoplasm, Mallory-Weiss syndrome
  - other structures: PUD, gastritis, pancreatitis, biliary colic
- **mediastinal**
  - lymphoma, thymoma
- **vascular**
  - dissecting aortic aneurysm, aortic rupture
- **surface structures**
  - costochondritis
  - rib fracture
  - skin (bruising, herpes zoster)
  - breast
- **anxiety/psychosomatic**

### Loss of Consciousness

- **hypovolemia**
- **vasovagal**
  - cardiac
    - structural or obstructive causes
      - ACS, AS, HCM, cardiac tamponade, constrictive pericarditis
    - arrhythmias *(see Arrhythmias, C16)*
  - respiratory
    - massive pulmonary embolism, pulmonary hypertension hypoxia, hypercapnia
  - neurologic
    - stroke/TIA (especially vertebrobasilar insufficiency), migraine, seizure
  - metabolic
    - anemia, hypoglycemia
  - drugs
    - antihypertensives, antiarrhythmics, diuretics
  - autonomic dysfunction
    - diabetic neuropathy
  - psychiatric
    - panic attack

### Local Edema

- inflammation/infection
- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis, venous insufficiency, chronic lymphangitis, lymphatic tumour infiltration, filariasis
**Generalized Edema**

- increased hydrostatic pressure/fluid overload
  - heart failure, pregnancy, drugs (e.g. CCBs), iatrogenic (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - liver cirrhosis, nephrotic syndrome, malnutrition
- increased interstitial oncotic pressure
  - myxedema
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism, exogenous steroids, pregnancy, estrogens

**Palpitations**

- cardiac
  - arrhythmias (PAC, PVC, SVT, VT), valvular heart disease, HCM
- endocrine
  - thyrotoxicosis, pheochromocytoma, hypoglycemia
- systemic
  - anemia, fever
- drugs
  - stimulants and anticholinergics
- psychiatric
  - panic attack

**Dyspnea**

- cardiovascular
  - acute MI, CHF/LV failure, aortic/mitral stenosis, aortic/mitral regurgitation, arrhythmia, cardiac tamponade, constrictive pericarditis, left-sided obstructive lesions (e.g. left atrial myxoma), elevated pulmonary venous pressure
- respiratory
  - airway disease
    - asthma, COPD exacerbation, upper airway obstruction (anaphylaxis, foreign body, mucus plugging)
  - parenchymal lung disease
    - ARDS, pneumonia, interstitial lung disease
  - pulmonary vascular disease
    - PE, pulmonary HTN, pulmonary vasculitis
  - pleural disease
    - pneumothorax, pleural effusion
- neuromuscular and chest wall disorders
  - C-spine injury
  - polymyositis, myasthenia gravis, Guillain-Barré syndrome, kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, hypercapnia
- drugs and poisons
  - CNS depressants, carbon monoxide poisoning

**Cardiac Diagnostic Tests**

**Electrocardiography Basics**

**Description**

- a graphical representation (time versus amplitude of electrical vector projection) of the electrical activity of the heart
- on the ECG graph
  - the horizontal axis represents time (at usual paper speed 25 mm/s)
    - 1 mm (1 small square) = 40 msec
    - 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting 10 mm/mV)
    - 1 mm (1 small square) = 0.1 mV
    - 10 mm (2 large squares) = 1 mV

Figure 5. ECG lead placement

Figure 6. ECG waveforms and normal values
Approach to ECGs

leads
- standard 12-lead ECG
  - limb leads: I, II, III, aVL, aVR, aVF
  - precordial leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
  - additional leads
  - right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
- lateral = I, aVL, V5, V6; inferior = II, III, aVF; anterior = V1-V4

Indications
- detect myocardial injury, ischemia, and the presence of prior infarction
- palpitations, syncope, antiarrhythmic drug monitoring
- arrhythmia surveillance in patients with documented or potentially abnormal rhythms
- surveillance of non-sustained arrhythmias that can lead to prophylactic intervention

Contraindications
- no absolute contraindications except patient refusal or electrode latex adhesive allergy

Approach to ECGs

Introduction
Below, we are presenting both the Classical Approach and the newer PQRSTU Approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same. These two approaches should help you better understand the concepts of ECG interpretation and equip you with the necessary skills to interpret ECGs in exam scenarios and clinical practice

Classical Approach to ECGs

RATE
- normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib)
- regular rhythm
to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 sec)
or remember 300-150-100-75-60-50-43 (rate falls in this sequence with the number of large squares between 2 QRS complexes)
- irregular rhythm
rate = 6 x number of R-R intervals in 10 s (the “rhythm strips” are 10 sec recordings)
atrial escape rhythm = 60-80 bpm; junctional escape rhythm = 40-60 bpm; ventricular escape rhythm = 20-40 bpm

RHYTHM
- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals e.g. AFlutter
- irregularly irregular: R-R intervals vary erratically e.g. AFib, VFib
- normal sinus rhythm (NSR)
P wave precedes each QRS; QRS follows each P wave
P wave axis is normal (positive in 2 out of the 3 following leads I, II, aVF)
rate between 60-100 bpm

AXIS
- mean axis indicates the direction of the mean vector
- can be determined for any waveform (PQRS T)
the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane – it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
  - normal axis: -30º to 90º (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis <-30º
  - right axis deviation (RAD): axis >90º
- QRS axis in the horizontal plane is not routinely calculated
  - transition from negative to positive is usually in lead V3

Differential Diagnosis for Left Axis Deviation (LAD)
- Left anterior hemiblock
- Inferior MI
- WPW
- RV pacing
- Normal variant
- Elevated diaphragm
- Lead misplacement
- Endocardial cushion defect

Differential Diagnosis for Right Axis Deviation (RAD)
- RVH
- Left posterior hemiblock
- Pulmonary embolism
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

Figure 7. Axial reference system
Each lead contains a (+) area displayed by the bold arrows. Impulses traveling toward the positive region of the lead results in an upward deflection in that lead. Normal QRS axis is between -30º and +90º
Approach to ECGs

ISCHEMIA/INFARCTION
- look for the anatomic distribution of the following ECG abnormalities (see Table 3, C8)
- ischemia
  - ST segment depression
  - T wave inversion (most commonly in V1-V6)
- injury/infarct
  - transmural (involving the epicardium)
  - ST elevation in the leads facing the area injured/infarcted
  - subendocardial
  - marked ST depression in the leads facing the affected area
  - may be accompanied by enzyme changes and other signs of MI

Figure 10. Typical ECG changes with infarction
- ST elevation: at least 1 mm in 2 adjacent limb leads or at least 1.2 mm in adjacent precordial leads in STEMI (signifies complete occlusion and transmural ischemic injury) vs. diffuse pattern in early pericarditis vs transient ST elevation in patients with coronary artery spasm (e.g. Prinzmetal angina) which can be slight or prominent (> 10 mm)
Approach to ECGs

• “typical” sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
     • usually in the first hours post infarct
     • in acute posterior MI, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads, that are not recorded in the standard 12-lead ECG) - get a 15-lead ECG
  3. significant Q waves: >40 msec or 1/3 of the total QRS and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
     • Q waves of infarction may appear in the very early stages, with or without ST changes
     • non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
  4. inverted T waves (one day to weeks after infarction)

• completed infarction
  • abnormal Q waves (Q waves may be present in leads III and aVL in normal individuals due to initial septal depolarization)
  • duration >40 msec (>30 msec in aVF for inferior infarction)
  • Q/QRS voltage ratio is >33%
  • present in at least 2 consecutive leads in the same territory
  • abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and occasionally in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

Table 3. Areas of Infarction/Ischemia (right dominant anatomy)

MISCELLANEOUS ECG CHANGES

Electrolyte Disturbances

• hyperkalemia
  • mild to moderate (K+ 5-7 mmol/L): tall peaked T waves
  • severe (K+ >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show bizarre patterns, axis shifts left or right, ST shift with tall T waves, eventually becomes a “sine wave” pattern

• hypokalemia
  • ST segment depression, prolonged QT interval, low T waves, prominent U waves (U>T)
  • enhances the toxic effects of digitalis

• hypercalcemia
  • shortened QT interval (more extracellular Ca2+ means shorter plateau in cardiac action potential)

• hypocalcemia
  • prolonged QT interval (less extracellular Ca2+ means longer plateau in cardiac action potential)

Figure 11. Hyperkalemia

Figure 12. Hypokalemia

Hypothermia

• sinus bradycardia
• when severe, prolonged QRS and QT intervals
• AFib with slow ventricular response and other atrial/ventricular dysrhythmias
• Osborne J waves: “hump-like” waves at the junction of the J point and the ST segment

Pericarditis

• early: diffuse ST segment elevation ± PR segment depression, upright T waves
• later: isoelectric ST segment, flat or inverted T waves
• ± tachycardia

Pacemakers

• Demand pacemaker has discharge (narrow vertical spike on ECG strip) prior to widened QRS
• Atrial pacemaker has discharge prior to P wave
• Triggered pacemaker has discharge following the P wave but prior to the widened QRS
• Atrial and ventricular pacing have discharge before the P wave and widened QRS wave
Drug Effects
- digitalis
  - therapeutic levels may be associated with “digitalis effect”
    - ST downsloping or “scooping”
    - T wave depression or inversion
    - QT shortening ± U waves
    - slowing of ventricular rate in AFib
  - toxic levels associated with:
    - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (see Arrhythmias, C16)
    - “regularization” of ventricular rate in AFib due to a junctional rhythm and AV dissociation
- amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, and some antibiotics (prolonged QT interval, U waves)

Pulmonary Disorders
- cor pulmonale (often secondary to COPD)
  - low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  - RAE and RVH with strain
  - multifocal atrial tachycardia (MAT)
- massive pulmonary embolism (PE)
  - sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain
  - most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

Alternative PQRSTU Approach to ECGs

Note: the information seen in this alternative approach – the PQRSTU Approach – is the same as the information in the Classical Approach; it is just organized in a different way based on the anatomy of the ECG
P WAVE

- the P wave represents atrial contraction; best leads: II, VI
  - lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
  - lead V1: the P wave is biphasic with a negative phase slightly greater than the positive phase
- atrial flutter: sawtooth P wave (Hint: flip the ECG upside-down to see it better if unclear)
- atrial fibrillation: absent P wave, may have fibrillatory wave, irregular rhythm
- right atrial enlargement: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
- left atrial enlargement: negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

P-R INTERVAL

- the P-R interval shows the delay between atrial and ventricular contraction that is mediated by the AV node; the magnitude of the delay is referred to as "dromotropy"
- positive dromotropy increases conduction velocity (e.g. epinephrine stimulation), negative dromotropy decreases velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
  - heart block
    - first degree: fixed, prolonged P-R interval
    - second degree Mobitz I/Wenckebach: steadily prolonging P-R interval to eventual dropped beat
    - second degree Mobitz II/Hay: fixed P-R interval with ratio of beat to dropped beat (e.g. for every 3 beats, there is one dropped beat [3:1])
    - third degree/complete: variable P-R intervals, P-P and R-R intervals individually constant but not in sync
  - atrial flutter
  - sinus bradycardia (normal to have long P-R if heart rate slow)
  - hypokalemia
  - "trifascicular" block - 1st degree AV block with LAHF and complete RBBB
- short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upswooping of the P-R segment into the QRS complex indicating pre-excitation)
  - accessory pathways
  - WPW
- low atrial rhythm

QRS COMPLEX

- the QRS is where ventricular contraction is visualized
- rate: check the R-R interval to see if it matches the P-P interval
- amplitude: check for hypertrophy (see Table 2, C7)
- narrow width (<120 msec) QRS means that the His-Purkinje system is being used
- wide width (>120 msec) QRS means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, drugs (e.g. TCAs, antiarrhythmics)
- Q wave: the first downward deflection of the QRS complex
  - significant Q wave: >40 msec or >33% of total QRS amplitude; indicate myocardial necrosis (new or historical)
- R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

ST SEGMENT

- located between QRS complex and the beginning of T wave
- corresponds to the completion of ventricular depolarization
- normally at the same level as "baseline/TP segment"
- ST elevation: please see the infarct section above
- ST depression: ischemia
  - schema which causes ST depression can result in myocardial damage (NSTEMI)
  - lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart

T WAVE

- this is the repolarization phase of the ventricles (repolarization of the atria are obscured by the QRS complex)
- typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (especially in V1 and V2)
- pathology when T wave variation occur in consecutive leads
  - inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of SIQ3T3 sign)
  - elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
  - variations: T wave alternans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
- inappropriate T wave concordance suggests ischemia or infarction
**Q-T INTERVAL**

- this represents the duration of ventricular depolarization and repolarization and is often difficult to interpret.
- corrected QT (QTc) is often used instead in practice to correct for the repolarization duration: \( QTc = \frac{QT}{\sqrt{RR}} \)
- normal QTc is 360-450 msec for males and 360-460 msec for females
  - increased (>450 msec for males and >460 msec for females): risk of Torsades de Pointes (a lethal tachyarrhythmia)
    - genetic Long QT Syndrome (often a channelopathy)
    - drugs: antibiotics, SSRIs, antipsychotics, antiarrhythmics
    - electrolytes: low Ca\(^{++}\), low Mg\(^{++}\), low K\(^{+}\)
    - others: hypothyroidism, hypothermia, cardiomyopathy
  - decreased (<360 msec): risk of VFib
    - electrolytes: high Ca\(^{++}\)
    - drugs: digoxin
    - others: hyperthyroidism

**U WAVE**

- origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions:
  - prominent (>25% of T wave): electrolyte (low K\(^{+}\)), drugs (digoxin, antiarrhythmics)
  - inverted (from T wave): electrolyte (low K\(^{+}\)), drugs (digoxin, antiarrhythmics)
- others: hyperthyroidism

### Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

<table>
<thead>
<tr>
<th>Table 4. Cardiac Enzymes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enzyme</td>
</tr>
<tr>
<td>--------</td>
</tr>
<tr>
<td>Troponin I, Troponin T</td>
</tr>
<tr>
<td>CK-MB</td>
</tr>
</tbody>
</table>

- check troponin I at presentation and 8 h later ± creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
  - AST and LDH also increased in MI (low specificity)
  - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
  - DDx of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN

### Ambulatory ECG

- description
  - extended ambulatory ECG of 24 or 48 h or 14 or 28 d duration
  - provides a view of only two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena that are often transient and of brief duration
  - **continuous loop**: a small, lightweight, battery operated recorder that records two or three channels of electrocardiographic data
  - **patient activated event markers**
  - minimum of 24-48 h
  - **implantable device**: subcutaneous monitoring device for the detection of cardiac arrhythmias
    - typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - can be used for months to years
- **indications**
  - evaluation of cardiac rhythm abnormalities
  - has also been used for assessing pacemaker and implantable cardioverter defibrillator function, evidence of myocardial ischemia, late potentials, and heart rate variability
- **contraindications**
  - no absolute contraindications
  - patient refusal
  - allergies (sensitivities to latex adhesive)
- **risks**: no absolute risks
Echocardiography

**Transthoracic Echocardiography (TTE)**
- **description:** ultrasound beams are directed across the chest wall to obtain images of the heart
- **indications**
  - evaluation of LVEF, wall motion abnormalities, myocardial ischemia and complications of MI
  - evaluation of chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion
  - evaluation of unexplained hypotension, murmurs, syncope, and congenital heart disease

**Transoesophageal Echocardiography (TEE)**
- **description:** invasive procedure used to complement transthoracic echocardiography
  - ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
  - better visualization of posterior structures, including left atrium, mitral, and aortic valves, inter-atrial septum
- **indications**
  - should be performed as the initial test in certain life-threatening situations, (e.g. aortic dissection) when other tests contraindicated (e.g. CT angiography in patient with renal failure)
  - intracardiac thrombi, tumours, valvular vegetations (infective endocarditis), aortic dissection, aortic atheromas, prosthetic valve function, shunt, technically inadequate transthoracic study
  - evaluation for left atrial/left atrial appendage thrombus in a patient with atrial fibrillation/atrial flutter to facilitate clinical decision making regarding electrical cardioversion or ablation
- **risks**
  - serious complications are extremely rare (<1 in 5,000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma

**Stress Echocardiography (SE)**
- **description:** echocardiography using either exercise (treadmill or bicycle) or pharmacologic agents (dobutamine) as the stress mechanism
- **indications**
  - useful alternative to other stress imaging modalities
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS when used to decide on potential efficacy of revascularization
  - evaluate the clinical significance of valvular heart disease
  - evaluation of myocardial viability, dyspnea of possible cardiac origin, mitral valve disease, aortic stenosis, mitral regurgitation, pulmonary hypertension, and patients with hypertrophic cardiomyopathy (for LVOT obstruction)
  - dobutamine
    - pharmacologic stress for patients who are physically unable to exercise; same indications as exercise stress echo
    - low dose dobutamine stress echo can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- **contraindications**
  - contraindications to exercise testing
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - AAA has been considered as a relative contraindication to exercise testing or dobutamine stress echocardiography

**Contrast Echocardiography with Agitated Saline Contrast**
- **description:** improves resolution and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - allows visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and intrapulmonary shunt

**Contrast Echocardiography with Transpulmonary Contrast Agents**
- **description:** newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction and wall motion abnormalities (in patients with technically inadequate echocardiograms), and intracardiac mass
- **risks**
  - risk of non-fatal MI and death are rare
  - ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis
Stress Testing

**EXERCISE TESTING**
- **description:** cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- **indications**
  - patients with intermediate (10-90%) pretest probability of CAD based on age, gender, and symptoms
  - ST depression <1 mm at rest, no left bundle branch block, no digoxin or estrogen use
  - exercise test results stratify patients into risk groups
    1. low risk patients can be treated medically without invasive testing
    2. intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
    3. high risk patients should be referred for cardiac catheterization
- **contraindications**
  - acute myocardial infarction (within 2 days)
  - unstable angina pectoris
  - uncontrolled arrhythmias causing symptoms of hemodynamic compromise
  - symptomatic severe valvular stenosis
  - uncontrolled symptomatic heart failure
  - active endocarditis or acute myocarditis or pericarditis
  - acute aortic dissection
  - acute pulmonary or systemic embolism
  - acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
  - termination of exercise testing
    - patient's desire to stop
    - drop in systolic blood pressure of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
    - moderate to severe angina
    - ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
    - increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
    - signs of poor perfusion (cyanosis or pallor)
    - technical difficulties in monitoring ECG or systolic blood pressure
    - sustained ventricular tachycardia
- **risks:** death, myocardial infarction, arrhythmia, hemodynamic instability, and orthopedic injury (<1-5/10,000 supervised tests)

**NUCLEAR CARDIOLOGY**
- **description:** myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
  - evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
  - predicts the likelihood of further cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
  - often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
  - stress with either treadmill or IV vasodilator stress (dipyridamole, adenosine, regadenoson)
  - images of the heart obtained during stress and at rest 3-4 h later
  - tracers
    - Thallium-201 ($^{201}$TI, a K$^+$ analogue)
    - Technetium-99 ($^{99}$Tc)-labeled tracer (sestamibi/Cardiolite” or hexamibi/Myoview”)
- **indications**
  - exercise MPI
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - in patients with previous imaging whose symptoms have changed
  - to diagnose ischemia
  - dipyridamole/adenosine MPI
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarkers
  - when ECG is cannot be interpreted appropriately due to LBBB or V-paced rhythm among patients unable to exercise, with the same indications as exercise MPI
- **contraindications**
  - contraindications to exercise testing
  - vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
  - pregnancy
- **risks:** radiation exposure

**STRESS ECHOCARDIOGRAPHY**
- see Echocardiography, C12
Cardiac Catheterization and Angiography

Right Heart Catheterization (Swan-Ganz Catheter)

- **Description:** also known as pulmonary artery catheterization
  - obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
  - can estimate cardiac output, systemic and pulmonary vascular resistance as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
  - right atrial, right ventricular, and pulmonary artery pressures are recorded
  - can also be used to measure the Cardiac Index (CI)
  - \( \text{CI} = \frac{\text{CO}}{\text{body surface area}} \)
  - cardic index is a measure of cardiac function
  - \(<1.8 \text{ L/min/m}^2\) usually means cardiogenic shock
  - \(2.6-4.2 \text{ L/min/m}^2\) is considered normal
  - pulmonary capillary wedge pressure (PCWP)
    - obtained by advancing the catheter to wedge in the distal pulmonary artery
    - records pressure measured from the pulmonary venous system
    - in the absence of pulmonary venous disease reflects left atrial pressure

- **Indications**
  - unexplained or unknown volume status in shock
  - severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
  - suspected or known pulmonary artery hypertension
  - severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt severe valvular disease, pulmonary hypertension) and undergoing corrective or other surgery

- **Contraindications**
  - lack of consent
  - infection at the insertion site
  - the presence of a right ventricular assist device
  - insertion during cardiopulmonary bypass

- **Risks**
  - complications for diagnostic catheterization <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - complication of insertion: atrial and/or ventricular arrhythmias (~3% of patients)
  - catheter misplacement or knotting (uncommon)
  - perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
  - complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

![Swan-Ganz catheter placement](https://via.placeholder.com/150)
Left Heart Catheterization

- **description**
  - accomplished by introducing a catheter into the brachial or femoral artery and advancing it through the aorta, across the aortic valve, and into the left ventricle
  - evaluates mitral and aortic valvular defects and myocardial disease
  - systolic and end-diastolic pressure tracings recorded
  - LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
  - cardiac output (measured by the Fick oxygen method or the indicator dilution method)

- **indications**
  - identification of the extent and severity of CAD and evaluation of left ventricular function
  - assessment of the severity of valvular or myocardial disorders (e.g. aortic stenosis or insufficiency, mitral stenosis or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
  - collection of data to confirm and complement noninvasive studies
  - determination of the presence of CAD in patients with confusing clinical presentations or chest pain of uncertain origin

- **contraindications**
  - severe uncontrolled hypertension
  - ventricular arrhythmias
  - acute stroke
  - severe anemia
  - active gastrointestinal bleeding
  - allergy to radiographic contrast
  - acute renal failure
  - uncontrolled congestive failure (so that the patient cannot lie flat)
  - unexplained febrile illness or untreated active infection
  - electrolyte abnormalities (e.g. hypokalemia)
  - severe coagulopathy

- **risks**
  - complications for diagnostic catheterization <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

Coronary Angiography

- **description**
  - radiographic visualization of the coronary vessels after injection of radiopaque contrast media
  - coronary vasculature accessed via the coronary ostia

- **indications**
  - to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
  - to determine the presence and extent of obstructive CAD
  - to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
  - can also be used when the diagnosis of CAD is uncertain and CAD cannot be reasonably excluded by noninvasive techniques

- **contraindications**: severe renal failure (due to contrast agent toxicity – must check patient’s renal status)

- **risks**: major complications <2%, but increased in patients with pre-existing renal failure (especially in diabetic patients)

---

**ACC/AHA 2011 Recommended Indications for Coronary Angiography**
- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

**Coronary Angiography**
Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

---

Figure 18. Coronary angiogram schematic

AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RCA = right coronary artery
Diagnostic Catheterization

- complications for diagnostic catheterization <1%
- inadequate diagnostic procedures occur in fewer than 1% of cases
- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, or prostacyclin)

Contrast-Enhanced CT Coronary Angiography

- description: fast ECG synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
- indications: often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
  - sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
- contraindications: allergy to contrast dye; severe renal dysfunction
- risks: radiation exposure

Magnetic Resonance Imaging

- description: offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
- indications: valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, assessment of viable myocardium, and assessment of cardiomyopathies
- contraindications: metallic foreign bodies/implants
- risks: hazards posed by certain metallic devices inside patients

CAR DiEASE

Arrhythmias

Mechanisms of Arrhythmias

Alterations in Impulse Formation

A. Abnormal Automaticity

- automaticity is a property of certain cardiomyocytes to spontaneously depolarize to their threshold voltage to generate action potentials in a rhythmic fashion. Under normal circumstances only cells in the specialized conduction system (SA node, AV node, and ventricular conduction system) exhibit natural automaticity. These cells are pacemaking cells. The automaticity of these cells can become abnormally increased or decreased. In disease (e.g. post-MI ventricular ischemia) cells in the myocardium outside the conduction system may inappropriately acquire the property of automaticity and contribute to abnormal depolarization. If these ectopic generators depolarize at a rate greater than the SA node, they assume pacemaking control and become the source of abnormal rhythm. Automaticity can be influenced by:
  - neurohormonal tone (sympathetic and parasympathetic stimulation)
  - abnormal metabolic conditions (hypoxia, acidosis, hypothermia)
  - electrolyte abnormalities
  - drugs (e.g. digitalis)
  - local ischemia/infarction
  - other cardiac pathology

- this mechanism is responsible for the accelerated idioventricular rhythm and ventricular tachycardia that often occurs 24-72 h post MI

B. Triggered Activity due to Afterdepolarizations

1. Early Afterdepolarizations

- occur in the context of action potential prolongation
- consequence of the membrane potential becoming more positive during repolarization (e.g. not returning to baseline)
- result in self-maintaining depolarizing oscillations of action potential, generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- basis for the degeneration of QT prolongation, either congenital or acquired, into Torsades de Pointes

Sinus Arrhythmia (SA)

- Normal P waves, with variation of the P-P interval by >120 msec due to varying rate of SA node

Respiratory SA

- Seen more often in young adults (<30 yr old)
- Normal, results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

Non-Respiratory SA

- Seen more often in the elderly
- Can occur in the normal heart; it marked may be due to sinus node dysfunction (e.g. in heart disease, or after digitalis toxicity)
- Usually does not require treatment
2. Delayed Afterdepolarizations
   - occur after the action potential has fully repolarized, but before the next usual action potential, thus called a delayed afterdepolarization
   - commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. “twitchy” pacemaker cells)

Alterations in Impulse Conduction

A. Re-Entry Circuits
   - the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 26, C20, for an example in the context of AV nodal re-entrant tachycardia)
   - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable zones which will promote the formation of re-entry circuits

B. Conduction Block
   - ischemia, fibrosis, trauma, and drugs can cause transient, permanent, unidirectional or bidirectional block
   - most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory period or zone of myocardium unexcitable due to fibrosis)
   - if block occurs along the specialized conduction system distal zones of the conduction system can assume pacemaking control
   - conduction block can lead to bradycardia or tachycardia when impaired conduction leads to re-entry phenomenon

C. Bypass Tracts
   - normally the only conducting tract from the atria to the ventricles is the AV node into the His-Purkinje system
   - congenital/acquired accessory conducting tracts bypass the AV node and facilitate premature ventricular activation before normal AV node conduction
   - see Pre-Excitation Syndromes, C21

Figure 19. Clinical approach to arrhythmias
Bradyarrhythmias

1. SA NODAL DYSFUNCTION

A. Sinus Bradycardia

- P axis normal (P waves positive in I and aVF)
- Rate <60 bpm; marked sinus bradycardia (<50 bpm)
- May be seen in normal adults, particularly athletes, and in elderly individuals
- Increased vagal tone or vagal stimulation; drugs (β-blockers, calcium channel blockers, etc.); ischemia/infarction

- Atropine; pacing for sick sinus syndrome

Figure 20. Sinus bradycardia

2. AV CONDUCTION BLOCKS

A. First Degree AV Block

- Prolonged PR interval (>200 msec)
- Frequently found among otherwise healthy adults

- No treatment required

Figure 21. First degree AV block

B. Second Degree AV Block: Type I (Mobitz I)

- A gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)
- AV block is usually in AV node (proximal triggers usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia

Figure 22. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V1)

B. Second Degree AV Block: Type II (Mobitz II)

- The PR interval is constant; there is an abrupt failure of conduction of a P wave
- AV block is usually distal to the AV node (i.e. bundle of His); increased risk of high grade or 3rd degree AV block

Figure 23. Second degree AV block (Mobitz II) (3:2 conduction) (lead V1)

B. Third Degree AV Block

- Complete failure of conduction of the supraventricular impulses to the ventricles; ventricular depolarization initiated by an escape pacemaker distal to the block
- Wide or narrow QRS, P-P and R-R intervals are constant, variable PR intervals; no relationship between P waves and QRS complexes (P waves “marching through”)

Management (see Electrical Pacing, C24)

Figure 24. Third degree AV block (complete heart block) (lead II)

Supraventricular Tachyarrhythmias

Presentation for SVT (and Pre-Excitation Syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying disease
- untreated tachycardias can cause cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- includes supraventricular and ventricular rhythms

Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS, unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

1. Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- occurs in normal subjects with increased sympathetic tone (e.g. exercise, emotions, pain), alcohol use, caffeinated beverages, drugs (e.g. β-adrenergic agonists, anticholinergic drugs, etc.)
- etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, PE, etc.
- treatment: treat underlying disease; consider β-blocker if symptomatic, calcium channel blocker if β-blockers contraindicated
2. Premature Beats
- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
  - junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or “traveling backward” P wave)
- treatment usually not required

3. Atrial Flutter
- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly the right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (2:1, 3:1, 4:1, etc.) or variable
- etiology: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy); commonly seen as 2:1 block with HR of 150
- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and bring out flutter waves
- treatment of acute atrial flutter
  - acute and if unstable (e.g. hypotension, CHF, angina) electrical cardioversion
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable:
    1. rate control: β-blocker, diltiazem, verapamil, or digoxin
    2. chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
- anticoagulation guidelines same as for patients with AFib
- treatment of long-term atrial flutter: antiarrhythmics, catheter radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter – i.e. whether right-sided isthmus-dependent or left-sided origin)

4. Multifocal Atrial Tachycardia (MAT)
- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm – 3 or more distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD, and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil), β-blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

5. Atrial Fibrillation
- see CCS Atrial Fibrillation Guidelines 2016 for details (free mobile app – iCCS available on iOS and Android)
- most common sustained arrhythmia
- incidence increases with age (10% of population >80 yr old)
- symptoms: palpitations, fatigue, syncope, may precipitate or worsen heart failure
- classification
  - lone: occurs in persons younger than 60 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - permanent/chronic: continuous AFib that is unresponsive to cardioversion or in which clinical judgement has led to a decision not to pursue cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. myocardial infarction, cardiac surgery, pulmonary disease, hyperthyroidism)
- may be associated with thromboembolic events (stroke risk can be assessed by CHADS2 score in nonvalvular AFib; CHA2DS2-VASc if the former gives a score of 0 or 1)
- initiation
  - single circuit re-entry and/or ectopic foci act as aberrant generators producing atrial tachycardia (350-600 bpm)
  - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
  - in some cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- maintenance
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib the more difficult it is to convert back to sinus rhythm
- consequences
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response of <200 bpm and the tachycardia leads to suboptimal cardiac output
  - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation – AFib is an important risk factor for stroke
Table 5. CHADS2 Risk Prediction for Non-Valvular AFib and Refer to AHA/ACC/HRS AFib Guidelines 2014 for more details

Figure 26. Atrial fibrillation (lead II)

- ECG findings
  - no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
  - irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
  - wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
  - loss of atrial contraction, thus no “a” wave seen in JVP no S4 on auscultation

- management (adapted from CCS Atrial Fibrillation Guidelines 2016)
  - major objectives (RACE): all patients with AFib (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and for the risk of bleeding, and most patients should receive either an oral anticoagulant or ASA (see below)
    1. Rate control: β-blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
       - digoxin can be considered as a therapeutic option to achieve rate control in patients whose response to beta-blockers and/or calcium channel blockers is inadequate or contraindicated
    2. Anticoagulation: use either warfarin or novel oral anticoagulant (NOACs) e.g. apixaban, dabigatran, rivaroxaban to prevent thromboembolism
       for patients with non-valvular AF (NV AF): oral anticoagulant (OAC) is recommended for most patients aged >65 yr or CHADS2 >= 1. ASA 81 mg is recommended only for patients with none of the risk outlined in the CCS algorithm (age <65 and no CHADS2: risk factors) who have arterial disease (coronary, aortic, or peripheral). Novel oral anticoagulant (NOAC) is to be used in preference to warfarin
    3. Cardioversion (electrical)
       - if AFib <24–48 h, can usually cardiovert without anticoagulation
       - if AFib >24–48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
       - if patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
    4. Etiology
       - HTN, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
       - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease
  - studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control versus rate-control strategy
  - however, many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible
  - newly discovered AFib
    - anticoagulants may be beneficial if high risk for stroke
    - if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
    - if AFib persists, 2 options
      1. rate control and anticoagulation (as indicated above)
      2. cardioversion (as above)
  - recurrent or permanent AFib
    - if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
    - patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations

 Lenient versus Strict Rate Control in Patients with Atrial Fibrillation
 NEJM 362:1263-1273
 Study: Randomized, multi-centre Netherlands prospective study, follow-up for at least 2 yr
 Population: 614 patients with permanent atrial fibrillation.
 Intervention: Lenient control (resting HR <110 bpm) or strict control (resting HR <80 bpm)
 Primary Outcomes: Death from cardiovascular causes, hospitalization for heart failure, and stroke, systemic embolism, bleeding, and life-threatening arrhythmic events.
 Results: Goal of the study was to establish whether lenient control was equivalent to strict control for prevention of primary outcomes. Resulting hazard ratios were not significantly different between the treatment groups (P = 0.001). Frequencies of hospitalization and adverse effects were also similar. More patients were able to maintain lenient targets (97.3%) compared to strict targets (86%).
 Conclusion: Lenient control was equivalent to strict control for prevention of primary outcomes in patients with atrial fibrillation. Furthermore, lenient control was more easily achieved.

 Rivaroxaban for Stroke Prevention in AFib – ROCKET-AF Trial
 NEJM 2011;365:883-891
 Study: Prospective, non-inferiority, double blind, RCT, median follow-up of 1.9 yr.
 Population: n=14,264 patients with AF (mean CHADS=2.3), Patients either had previous thromboembolism or ≥3 risk factors.
 Intervention: Patients were randomized to receiving rivaroxaban or warfarin.
 Outcome: Composite of strokes and systemic thromboembolic event (STE).
 Results: The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.89; 95% CI 0.74-1.03; p < 0.001 for noninferiority; p = 0.12 for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03; 95% CI 0.96-1.11; p = 0.44. There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%, p = 0.02) and fatal bleeding (0.2% vs. 0.5%, p = 0.003) for rivaroxaban.
 Conclusions: In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.
6. **AV NODAL RE-ENTRANT TACHYCARDIA (AVNRT)**

- re-entrant circuit using dual pathways (fast conducting β-fibres and slow conducting α-fibres) within
  or near the AV node; often found in the absence of structural heart disease – cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset
- fast regular rhythm: rate 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex
  - treatment
    - acute: Valsalva maneuver or carotid sinus pressure technique, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
    - long-term: 1st line – β-blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone; 3rd line – catheter ablation

---

**Pre-Excitation Syndromes**

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

**Wolff-Parkinson-White Syndrome**

- congenital defect present in 1.5-2/1,000 of the general population
- an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively ‘bypassing’ AV node
- since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called “delta wave”
- atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad “fusion complex”
- ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur – most often AVRT and AFib
A Fib in WPW Patients
- A Fib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - it is usually intermittent rather than persistent or permanent
  - rapid atrial depolarizations in A Fib are conducted through the bypass tract which is not able to filter impulses like the AV node can
  - consequently the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens
- treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction (digoxin, β-blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
  - long-term: ablation of bypass tract if possible

AV Re-Entrant Tachycardia
- re-entrant loop via accessory pathway and normal conduction system
- initiated by a premature atrial or ventricular complex
  - orthodromic AVRT: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
  - comprises 95% of the reentrant tachycardias associated with WPW syndrome
    - antidromic AVRT: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
    - treatment
      - acute: similar to AVNRT except avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
      - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
        - drugs such as flecainide and procainamide can be used

Ventricular Tachyarrhythmias

Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)
- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
  - origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
  - PVCs may be benign but are usually significant in the following situations
    - consecutive (≥3 = VT) or multiform (varied origin)
    - PVC falling on the T wave of the previous beat (“R on T phenomenon”): may precipitate ventricular tachycardia or VF

Accelerated Idioventricular Rhythm
- ectopic ventricular rhythm with rate 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment

Ventricular Tachycardia (VT)
- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate >200 bpm and complexes resemble a sinusoidal pattern
  - “sustained VT” if it lasts longer than 30 s
  - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
  - AV dissociation; bizarre QRS pattern
  - also favour Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")

- monomorphic VT
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - typically result from intraventricular re-entry circuit
  - potential causes: chronic infarct scarring, acute MI/ischemia, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances

- polymorphic VT
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
  - potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation
  - treatment
    - sustained VT (>30 s) is an emergency, requiring immediate treatment
    - hemodynamic compromise: electrical cardioversion
    - no hemodynamic compromise: electrical cardioversion, lidocaine, amiodarone, type Ia agents (procainamide, quinidine)
**Table 6. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy**

*If patient >65 yr and previous MI or structural heart disease, then chance of VT >95%*

**May terminate VT in some patients with no structural heart disease**

**Torsades de Pointes**
- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – "twisting of the points"
- looks like usual VT except that QRS complexes "rotate around the baseline" changing their axis and amplitude
- ventricular rate >100 bpm, usually 150-300 bpm
- etiology: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing, isoproterenol and correct underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

**Ventricular Fibrillation (VFib)**
- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and cardiac output, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines
Sudden Cardiac Arrest

Definition
- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; Vfib is most common cause

Etiology
- primary cardiac pathology
  - ischemia/MI
  - LV dysfunction
  - severe ventricular hypertrophy
  - HCM
  - AS
- congenital heart disease e.g. arrhythmogenic right ventricular dysplasia
- mutations in cardiac ion channels e.g. long QT syndrome, Brugada syndrome

Management
- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echo)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, β-blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see Anesthesia and Perioperative Medicine, A31)

Electrophysiology Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of VT

Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

Pacemaker Indications
- SA node dysfunction (most common): symptomatic bradycardia ± hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

Pacemaker Complications
- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism) pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure pacemaker syndrome and pacemaker mediated tachycardia

Pacing Techniques
- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- can sense and pace atrium, ventricle, or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

Implantable Cardioverter Defibrillators

- sudden cardiac death (SCD) usually results from ventricular fibrillation (Vfib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/Vfib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see Heart Failure, C34 for current treatment recommendations
Catheter Ablation

Techniques
- radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: new technology which uses a probe with a tip that can decrease in temperature to 20°C and -70°C. Produces small, necrotic lesions similar to RF ablation; when brought to -20°C, the catheter tip reversibly freezes the area; bringing the tip down to -70°C for 5 min permanently scars the tissue
  - advantage: can "test" areas before committing to an ablation
  - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)

Indications
- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm, with an accessory AV connection as the retrograde limb
  - corrected by targeting the accessory pathway
- atrial flutter: re-entry pathway in right atrium
- A Fib: potential role for pulmonary vein ablation
- ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated)

Major Complications
- 1% of patients
- death: 0.1-0.2%
- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

Ischemic Heart Disease

Epidemiology
- most common cause of cardiovascular morbidity and mortality
- Canadian-led INTERHEART study showed that 9 modifiable risk factors accounted for >90% of MI
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
  - according to the Framingham Heart Study, men develop coronary heart disease at a rate double that of women for age <60; incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease see Family Medicine, FM7

* Major risk factor
Chronic Stable Angina

**Definition**
- symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

**Etiology and Pathophysiology**
- factors that decrease myocardial oxygen supply:
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased SaO₂: hypoxemia
  - congenital anomalies
- factors that increase myocardial oxygen demand:
  - increased heart rate: hyperthyroidism
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, aortic stenosis

**Signs and Symptoms**
- **typical**
  1. retrosternal chest pain, tightness or discomfort radiating to left (± right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety
  2. predictably precipitated by the “3 Es”: exertion, emotion, eating
  3. brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above)
- non-cardiac chest pain (meets <1 of the above)
- Levine's sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

**Clinical Assessment**
- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- stress testing (see Stress Testing, C13) or angiography
- echo
- to assess systolic murmur suggestive of aortic stenosis, mitral regurgitation, and/or HCM
- to assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of CHF

**Differential Diagnosis**
- see Differential Diagnosis of Common Presentations, C4

---

**Figure 35. Pathophysiology of atherosclerosis**

- Hypertension
- Diabetes Mellitus
- Smoking
- Dyslipidemia
- Rheumatoid Arthritis

- Endothelial injury
- Monocyte recruitment
- Enhanced LDL permeability
  - Monocytes enter into initial space and differentiate into macrophages – LDL is converted into oxidized-LDL (OX-LDL)
  - Macrophages take up OX-LDL via scavenger receptors to become foam cells (‘fatty streak’ and lipid core of plaque)
- Cytokine and growth factor signaling from damaged endothelium and macrophages promote medial smooth muscle cell migration into the intima, proliferation (intimal hyperplasia), and release of matrix to form the fibrous cap of plaque – rupture depends on balance of pro- and anti-proteases, magnitude of necrosis and location of plaque (bifurcation sites are exposed to greater shear stress)
  - Calcification
  - Plaque rupture
  - Hemorrhage into plaque
  - Fragmentation
  - Wall weakening
- Increased vessel wall rigidity
- Thrombosis
- Lumen narrowing
- Emboli
- Aneurysm
Treatment of Chronic Stable Angina

1. General Measures
- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise)
- treatment of risk factors: statins (see Endocrinology, E5, Family Medicine, FM10 for target lipid guidelines), antihypertensives, etc.
- pharmacological therapy to stabilize the coronary plaque to prevent rupture and thrombosis

2. Antiplatelet Therapy (first-line therapy)
- ASA
- clopidogrel when ASA absolutely contraindicated

3. β-blockers (first-line therapy – improve survival in patients with hypertension)
- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β2 receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

4. Nitrates (symptomatic control, no clear impact on survival)
- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

5. Calcium Channel Blockers (CCBs, second-line or combination)
- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with β-blockers may cause symptomatic sinus bradycardia or AV block

6. ACE Inhibitors (ACEI, not used to treat symptomatic angina)
- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
- benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction, or LV systolic dysfunction)

7. Invasive Strategies
- revascularization (see Coronary Revascularization, C31 and COURAGE trial sidebar)

VARIANT ANGINA (PRINZMETAL’S ANGINA)
- myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
- typically ST elevation on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs

SYNDROME X
- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

Acute Coronary Syndromes

Definition
- ACS includes the spectrum of UA, NSTEMI and STEMI; this distinction aids in providing the appropriate therapeutic intervention
- MI is defined by evidence of myocardial necrosis. It is diagnosed by a rise/fall of serum markers plus any one of:
  - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
  - ECG changes (ST-T changes, new BBB or pathological Q waves)
  - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
  - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
- NSTEMI meets criteria for myocardial infarction without ST elevation or BBB
- STEMI meets criteria for myocardial infarction characterized by ST elevation or new BBB
Ischemic Heart Disease

Cardiology and Cardiac Surgery

Toronto Notes 2018

• UA is clinically defined by any of the following:
  ■ accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion decreased response to treatment
  ■ angina at rest
  ■ new-onset angina
  ■ angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery bypass grafting [CABG])

Investigations

• history and physical
  ■ note that up to 30% of MIs are unrecognized or “silent” due to atypical symptoms – more common in women, DM, elderly, post-heart transplant (because of denervation)
• ECG
• CXR
• labs
  ■ serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see Cardiac Biomarkers, C11)
  ■ CBC, INR/PTT electrolytes and magnesium, creatinine, urea glucose, serum lipids
  ■ draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

MANAGEMENT OF ACUTE CORONARY SYNDROMES

1. General Measures

• ABCs: assess and correct hemodynamic status first
• bed rest, cardiac monitoring, oxygen
• nitroglycerin SL followed by IV
• morphine IV

2. Anti-Platelet and Anticoagulation Therapy

• see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
• ASA chewed
• NSTE MI
  ■ ticagrelor in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight heparin or IV unfractionated heparin (UFH) (LMWH preferable, except in renal failure or if CABG is planned within 24 h)
  ■ clopidogrel used if patient ineligible for ticagrelor
  ■ if PCI is planned: ticagrelor or prasugrel and consider IV GP IIb/IIIa inhibitor (e.g. abciximab)
  ■ clopidogrel used if patient ineligible for ticagrelor and prasugrel
  ■ prasugel contraindicated in those with a history of stroke/TIA, and avoidance of or lower dose is recommended for those >75 yr old or weighing under 60 kg (TRITON-TIMI 38)
• anticoagulation options depend on reperfusion strategy:
  ■ primary PCI: UFH during procedure; bivalirudin is a possible alternative
  ■ thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  ■ no reperfusion: LMWH (enoxaparin) until discharge from hospital
  ■ continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)

3. β-blockers

• STEMI contraindications include signs of heart failure low output states, risk of cardiogenic shock, heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated
• if β-blockers are contraindicated or if β-blockers/nitrates fail to relieve ischemia, non-dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel blockers do not prevent MI or decrease mortality)

4. Invasive Strategies and Reperfusion Options

• UA/NSTEMI: early coronary angiography ± revascularization if possible is recommended with any of the following high-risk indicators:
  ■ recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  ■ CHF or LV dysfunction
  ■ hemodynamic instability
  ■ high (≥3) TIMI risk score (tool used to estimate mortality following an ACS)
  ■ sustained ventricular tachycardia
  ■ dynamic ECG changes
  ■ high-risk findings on non-invasive stress testing
  ■ PCI within the previous 6 mo
  ■ repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high risk features
  ■ note: thrombolysis is NOT administered for UA/NSTEMI

Note: more accurate risk quantification scores for UA/NSTEMI exist, such as the GRACE Risk Score; however, TIMI is still used most often
- STEMI
  - after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - goal is to re-perfuse artery: thrombolysis (“EMS-to-needle”) within 30 min or primary PCI (“EMS-to-balloon”) within 90 min (depending on capabilities of hospital and access to hospital with PCI facility)
  - thrombolysis
    - preferred if patient presents ≤12 h of symptom onset, and <30 min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
- PCI
  - early PCI (≤12 h after symptom onset and <90 min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
  - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centres (JAMA 2004;291:736-739)
  - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

**Long-Term Management of ACS**
- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

1. **General Measures**
   - education
   - risk factor modification

2. **Antiplatelet and Anticoagulation Therapy**
   - see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
   - ECASA 81 mg daily
   - ticagrelor 90 mg twice daily or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
   - clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
   - ± warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)
3. **β-Blockers** (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

4. **Nitrates**
   - alleviate ischemia but do not improve outcome
   - use with caution in right-sided MI patients who have become preload dependent

5. **Calcium Channel Blockers** (NOT recommended as first line treatment, consider as alternative to β-blockers)

6. **Angiotensin-Converting Enzyme Inhibitors**
   - prevent adverse ventricular remodelling
   - recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
   - recommended for symptomatic CHF; reduced LVEF (<40%), anterior MI
   - use ARBs in patients who are intolerant of ACEI; avoid combining ACE and ARB

7. **± Aldosterone Antagonists**
   - if on ACEI and β-blockers and LVEF <40% and CHF or DM
   - significant mortality benefit shown with eplerenone by 30 d

8. **Statins** (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

9. **Invasive Cardiac Catheterization if indicated** (risk stratification)

PERCUTANEOUS CORONARY INTERVENTION

- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

**Indications**
- medically refractory angina
- NSTEMI/UA with high risk features (e.g. high TIMI risk score, see sidebar C28)
- primary/rescue PCI for STEMI

**Balloon Angioplasty and Intracoronary Stenting**
- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
- bare metal stent (BMS) versus drug-eluting stents: PRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
- coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus)
- reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
- complication: late stent thrombosis (5 events per 1,000 stents implanted)
Adjunctive Therapies
- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or ≥12 mo with DES
  - DAPT study showed benefit of dual antiplatelet therapy beyond 12 mo
- ASA and prasugrel can be considered for those at increased risk of stent thrombosis

Procedural Complications
- mortality and emergency bypass rates <1%
- nonfatal MI: approximately 2-3%

CORONARY ARTERY BYPASS GRAFT SURGERY
- objective of CABG is complete reperfusion of the myocardium

Indications
- CABG
  - ≥50% diameter stenosis in the left main coronary artery
  - ≥70% diameter stenosis in three major coronary arteries
  - ≥70% diameter stenosis in the proximal LAD artery plus one other major coronary artery
  - survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant (≥70% diameter) stenosis in a major coronary artery
- other
  - ≥70% diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
  - ≥70% diameter stenosis in the proximal LAD artery and evidence of ischemia
  - multivessel CAD in patients with diabetes
  - LV systolic dysfunction (LVEF 35% to 50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- PCI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG
  - CABG or PCI
    - one or more significant (≥70% diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

Study: RCT comparing whether shortening the duration of clopidogrel therapy from 6 months to 6 weeks after DES implantation was associated with superior net clinical outcome in patients receiving concomitant aspirin and OAC.

Population: 514 patients from 3 European centres receiving DES implantation on OAC and aspirin.

Intervention: 6 week vs. 6 month clopidogrel therapy post-DES

Outcome: Death, myocardial infarction, definite stent thrombosis, stroke, thrombolysis in myocardial infarction major bleeding at 9 months

Results: Primary endpoint occurred in 8.9% in 6 week group vs. 27 patients in 6 month group (HR: 1.14; 95% CI: 0.88-1.91; p-0.63)

Conclusions: Six weeks of triple therapy is not superior to 6 months. Physician should weigh trade-off between ischemic and bleeding risk when choosing shorter or longer duration of triple therapy

Percutaneous Coronary Intervention vs. Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease: The SYNTAX Trial. NEJM 2009;360:961-972

Study: Prospective RCT.

Population: 1,800 patients with untreated three-vessel or left main coronary artery disease and anatomically equivalent for both Percutaneous Intervention (PCI) and Coronary Artery Bypass Graft (CABG).

Intervention: PCI vs. CABG.

Outcome: Composite of death from any cause, stroke, MI, or repeat revascularization in 12 mo post-intervention.

Results: Incidence of primary outcome was lower in the CABG intervention vs. PCI (12.4% vs. 17.8%, p=0.002, NNT=19). PCI was associated with significantly higher rates of repeat revascularization (13.5% vs. 5.9%, p<0.001) and cardiac death (13.7% vs. 2.1%, p=0.009), while CABG had higher rates of stroke (2.2% vs. 0.6%, p=0.03).

Conclusions: In patients with three-vessel or left main coronary artery disease CABG is superior to PCI in preventing major adverse cardiac, cerebrovascular events within 12 mo of intervention.
Operative Issues
- Left ventricular (LV) function is an important determinant of outcome of all heart diseases
- Patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- Assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echocardiography, PET scanning, or MRI

CABG and Antiplatelet Regimens
- Please refer to CCS guidelines – 2012 update on antiplatelet therapy – for more information if possible
- Prior to CABG, clopidogrel, and ticagrelor should be discontinued for 5 days and prasugrel for 7 days before surgery
- Dual antiplatelet therapy should be continued for 12 months in patients with ACS within 48–72 hours after CABG
- ASA (81 mg) continued indefinitely (can be started 6 hours after surgery)
- Patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

Procedural Complications
- CABG using cardiopulmonary bypass (CPB)
  - Stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - Immunosuppression
  - Systemic inflammatory response leading to
    - Myocardial dysfunction
    - Renal dysfunction
    - Neurological injury
    - Respiratory dysfunction
    - Coagulopathies

OFF-PUMP CORONARY ARTERY BYPASS SURGERY

Procedure
- Avoids the use of CPB by allowing surgeons to operate on a beating heart
  - Stabilization devices (e.g., Genzyme Immobilizer®) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - Procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

Indications
- Used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g., Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- **Absolute contraindications**: hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- **Relative contraindications**: cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

Outcomes
- OPCAB decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
- No significant difference in terms of survival at 2 years, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG), or medication usage compared to on-pump CABG

Safety and Efficacy of Drug-Eluting and Bare Metal Stents
Circulation 2009; 119:3193-3206
Study: Meta-analysis of RCTs and observational studies. 22 RCTs and 34 observational studies.
Population: 8,470 and 182,901 patients in RCTs and observational studies respectively who underwent percutaneous coronary intervention.
Intervention: Drug-Eluting Stents (DES) versus Bare Metal Stents (BMS).
Outcome: All-cause mortality, myocardial infarction (MI), and target vessel revascularization (TVR).
Result: No difference in mortality was found between DES vs. BMS by RCTs, while observational studies showed significantly lower mortality rates in DES-treated patients (hazard ratio [HR] 0.79, p<0.001). No difference in MI incidence was found in RCTs, while lower incidences of MI were found in observational studies (HR 0.87, p=0.014). DES has a significantly lower TVR rate in both RCT (HR 0.45, p<0.001) and observational studies (HR 0.46, p<0.001).
Conclusions: DES significantly reduces rates of TVR compared to BMS. Although there is no difference in mortality or MI incidence as found by RCTs, observational studies suggest lower mortality and MI rates in patients with DES over BMS.
Heart Failure

- see also CCS Heart Failure Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores) as well as the CCS Heart Failure Guidelines Compendium available at CCS.ca

Congestive Heart Failure

Low-Output HF

due to decreased cardiac output

Systolic Dysfunction

Injury and ischemia in myocardium
Infarction and inflammation

Diastolic Dysfunction

Infiltration and fibrosis
Thick, stiffened myocardium

High-Output HF

due to increased cardiac demand

Increased Cardiac Workload

- Myocardial stress
- Volume overload
- Pressure overload

Compensation

- Increased heart rate and myocardial contractility
- Increased blood volume

Decompensation

- Deterioration of heart function
- Heart unable to maintain blood circulation

Increased venous congestion

Pulmonary vascular congestion
- Fluid accumulation in lungs, apnea, shortness of breath, fatigue, weakness

Does this Dyspneic Patient in the Emergency Department have Congestive Heart Failure?

Figure 39. Congestive Heart Failure

Dichotomies of Heart Failure

- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

Use Ejection Fraction to Grade LV Dysfunction

- Grade I (EF >60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)
Pathophysiology
- most common causes are ischemic heart disease, hypertension and valvular heart disease
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodelling
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (concentric remodelling) and eventually interstitial fibrosis
  - volume overload (e.g. AI) leads to dilatation (eccentric remodelling)
  - both processes lead to maladaptive changes contributing to disease process
  - results in decreased volume cardiac output resulting in activation of the SNS and RAAS
- Na\(^+\) and water retention, increasing preload and afterload, tachycardia perpetuates cycle of increasing cardiac demand and decompensation

Heart Failure with Reduced Ejection Fraction
- impaired myocardial contractile function \(\rightarrow\) decreased LVEF and SV \(\rightarrow\) decreased CO

Volume Overload and Eccentric Remodelling is the Typical Phenotype
- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF, LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - alcohol (and other toxins)
    - myocarditis
    - dilated cardiomyopathy (multiple causes – see Dilated Cardiomyopathy, C40)

Heart Failure with Preserved Ejection Fraction
- previously known as “diastolic heart failure”
- concentric remodelling with a “stiff” left ventricle is the typical phenotype
- 1/2 of patients with heart failure have preserved EF; confers similar prognosis to HRF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal EF
- causes
  - transient ischemia (relaxation of myocardium is active and requires ATP)
  - permanent
    - severe hypertrophy (HTN, aortic stenosis, HCM)
    - restrictive cardiomyopathy (e.g. amyloid)
  - MI

High-Output Heart Failure
- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget’s disease, renal disease, hepatic disease

Precipitants of Symptomatic Exacerbations
- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection, etc.
  - medication non-compliance
  - dietary indiscretion e.g. salt intake
  - obstructive sleep apnea

Investigations
- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH ± ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchial alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E’e), cardiac dimensions, wall motion abnormalities, RVSP (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

Likelihood of heart failure
- Low = 0-5
- Intermediate = 6-8
- High = 9-14

Brain natriuretic peptide (BNP) is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Ridgway et al. is commonly used. A score of <6 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 96% and specificity of 84% (p = 0.001) for the diagnosis of acute heart failure.

New York Heart Association (NYHA)

Functional Classification of Heart Failure
- Class I: ordinary physical activity does not cause symptoms of HF
- Class II: comfortable at rest, ordinary physical activity results in symptoms
- Class III: marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- Class IV: inability to carry out any physical activity without discomfort; symptoms may be present at rest

Toronto Notes 2018
Acute Treatment of Pulmonary Edema

- treat acute precipitating factors (e.g., ischemia, arrhythmias)
- L – Lasix (furosemide) 40–500 mg IV
- M – morphine 2–4 mg IV; decreases anxiety and preload (venodilation)
- N – nitroglycerin: topical/IV/SI – use with caution in preload-dependent patients (e.g., right HF or RV infarction) as it may precipitate CV collapse
- O – oxygen: in hypoxemic patients
- P – positive airway pressure (CPAP/BiPAP); decreases preload and need for ventilation when appropriate
- P – position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP, other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency β1 agonist)
      - high dose: increases SVR (low potency β1 agonist) which is undesirable
  - dobutamine
    - β1-selective agonist causing inotropy, tachycardia, hypotension (low dose) or hypertension (high dose); most serious side effect is arrhythmia, especially AF
  - phosphodiesterase inhibitors (milrinone)
    - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP) if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - intra-aortic balloon pump (IABP) - reduces afterload via systemic unloading and improves coronary perfusion via diastolic augmentation
  - left or right ventricular assist device (LVAD/RVAD)
  - cardiac transplant

Long-Term Management

- overwhelming majority of evidence-based management applies to HFREF
- currently no proven pharmacologic therapies shown to reduce mortality in HFPEF; control risk factors (e.g., hypertension)

Conservative Measures

- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
- multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

Non-Pharmacological Management

- from CCS guidelines (2013 update)
- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

Pharmacological Therapy

1. Renin-angiotensin-aldosterone blockade

   - ACEI: standard of care – slows progression of LV dysfunction and improves survival
   - all asymptomatic patients functional class II IV
   - all asymptomatic patients with LVEF <40%
   - post-MI
   - angiotensin II receptor blockers
     - second-line to ACEI if not tolerated, or as adjunct to ACEI if β-blockers not tolerated
     - combination with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, the need for dialysis and increase (CHARM, ONTARGET)
   - combination angiotensin II receptor blockers with nephrilysin inhibitors (ARNI) is a new class of medication that has morbidity and mortality benefit over ACEI alone; it has been recommended to replace ACEI or ARBs for patients who have persistent symptoms (PARADIGM HF)

2. β-blockers: slow progression and improve survival

   - class I-III with LVEF <40%
   - stable class IV patients
   - carvedilol improves survival in class IV HF (COMET)
   - note: should be used cautiously, titrate slowly because may initially worsen CHF

Can the Clinical Examination Diagnose Left-Sided Heart Failure in Adults?

From The Rational Clinical Examination JAMA 2009. http://www.jamaevidence.com/content/3471892
Study: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of CHF.
Results: The diagnosis of left ventricular dysfunction in patient after an MI based on the presence of radiographic pulmonary venous congestion with edema, rales, and third heart sound had a positive likelihood ratio (+LR) of 3.1 (95% CI 1.7–5.8) and a negative likelihood ratio (–LR) of 0.41 (95% CI 0.30–0.56). Female sex was -LR of 1.8 (95% CI 1.2–2.2) and SBP ≥160 mmHg (+LR, 1.8 [95% CI 1.3–2.4]) were the most indicative for diastolic dysfunction. Heart rate ≥100/min (+LR 0.43 [95% CI 0.29–0.63]) and left atrial ECG abnormality (+LR 0.42 [95% CI 0.26–0.63]) were most indicative for systolic dysfunction.
Conclusions: Patients with signs, symptoms, and risk factors for systolic dysfunction should receive an ECG and CPR. Female sex and SBP ≥160 mmHg are suggestive of diastolic dysfunction; heart rate ≥100/min and left atrial ECG abnormality suggest systolic dysfunction.
3. **Mineralocorticoid receptor (aldosterone) antagonists**: mortality benefit in symptomatic heart failure and severely depressed ejection fraction
   - spironolactone or eplerenone symptomatic heart failure in patients already on ACEI, beta blocker and loop diuretic
   - note: potential for life threatening hyperkalemia
   - monitor K⁺ after initiation and avoid if Cr >220 µmol/L or K⁺ >5.2 mmol/L

4. **Diuretics**: symptom control, management of fluid overload
   - furosemide (40-500 mg daily) for potient diuresis
   - metolazone may be used with furosemide to increase diuresis
   - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by β-blockers, ACEI, ARBs, and aldosterone antagonists

5. **Digoxin and cardiac glycosides**: digoxin improves symptoms and decreases hospitalizations, no effect on mortality
   - indications: patient in sinus rhythm and symptomatic on ACEI, or CHF and AFlb
   - patients on digitalis glycosides may worsen if these are withdrawn.

6. **Antiarrhythmic drugs**: for use in CHF with arrhythmia
   - can use amiodarone, β-blocker, or digoxin

7. **Anticoagulants**: warfarin for prevention of thromboembolic events
   - prior thromboembolic event or AFlb, presence of LV thrombus on echo

### Procedural Interventions
- resynchronization therapy: symptomatic improvement with biventricular pacemaker
- consider if QRS >130 msec, LVEF <35%, and persistent symptoms despite optimal therapy
- greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS >150 msec
- ICD: mortality benefit in 1st prevention of sudden cardiac death
- prior MI, optimal medical therapy, LVEF <30%, clinically stable
- prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see Ventricular Assist Devices, C38)
- cardiac transplantation (see Cardiac Transplantation, C38)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see Valvular Heart Disease, C43)

### Sleep-Disordered Breathing
- 45-55% of patients with CHF have sleep disturbances, including Cheyne-Stokes breathing and sleep apnea (central or obstructive)
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating symptoms of sleep apnea with secondary beneficial effects in cardiac function and symptoms

</tbody>
</table>

### Chronic Treatment of CHF
- ACEI
- β-blockers
- Mineralocorticoid receptor antagonists
- Diuretic
- Inotrope
- Antiarrhythmic
- Anticoagulant

*Mortality benefit*
**Cardiac Transplantation**

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1 yr survival is 85-90%, 3 yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

**Indications for Surgery**
- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption <14 mL/kg/min in absence of β-blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF <30%; recurrent, symptomatic ventricular arrhythmias)
- exclusion of all surgical alternatives to cardiac transplantation

**Relative Contraindications**
- incurable malignancy
- major systemic illness
- irreversible major organ disease
- active systemic infection
- obesity
- irreversible pulmonary HTN (pulmonary vascular resistance [PVR] >6 Wood units)
- severe COPD (FEV₁ <1 L)
- active drug addiction or alcoholism

**Prerequisites**
- psychosocial stability
- medically compliant and motivated

**Complications**
- rejection
  - common, <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft CAD
  - approximately 50% develop graft CAD within 5 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
  - cutaneous neoplasms most common, followed by non-Hodgkin’s lymphoma and lung cancer
  - immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

**Ventricular Assist Devices**
- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD)
- indications:
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy (“destination therapy”)
  - post-operative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
    - IABP is a catheter based device inserted into the femoral artery and advanced to the descending aorta that decreases myocardial O₂ demand and increases blood flow to coronary arteries
    - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
  - post-operative cardiogenic shock

**REMATCH Trial**

**Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation**

**Effects of Donor Pre-Treatment with Dopamine on Survival After Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nestled in a Randomized Controlled Multicentre Trial**

**REMATCH Trial:**

Increased survival of 23% vs. 8% with LVAD vs. medical management of heart failure after 2 yr. Heartmate VAD has a biologic surface, the efore, does not require long-term anticoagulation but higher risk of infection.

**Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation:**

Patients with a continuous flow, NYHA class I-II, LVAD that are stable 2 mo post LVAD implantation qualify for private driving only and are disqualified from commercial driving.
Myocardial Disease

Definition of Cardiomyopathy
- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2º to MI often termed "ischemic cardiomyopathy", is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

Table 14. Summary Table for CHF and Myocardial Disease

Myocarditis

Definition
- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

Etiology
- idiopathic
- infectious
  - viral (most common): parvovirus B19, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps
  - bacterial: S. aureus, C. perfringens, C. diphtheriae, Mycoplasma, Rickettsia
  - fungi
  - spirochetal (Lyne disease – Borrelia burgdorferi)
  - Chagas disease (Trypanosoma cruzi), toxoplasmosis
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (SLE, rheumatoid arthritis, others), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

Signs and Symptoms
- constitutional symptoms
- acute CHF - dyspnea, tachycardia, elevated JVP
- chest pain – due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- pre-syncpe/syncope/sudden death

Investigations
- ECG: non-specific ST-T changes ± conduction defects
- blood work
  - increased CK, troponin, LDH, and AST with acute myocardial necrosis ± increased WBC, ESR, ANA, rheumatoid factor, complement levels
  - blood culture, viral titres and cold agglutinins for Mycoplasma
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- cardiovascular magnetic resonance: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- myocardial biopsy

Management
- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible
Prognosis
- often unrecognized, and may be self-limited
- myocarditis treatment trial showed 5 yr mortality between 25-50%
- giant cell myocarditis, although rare can present with fulminant CHF and be rapidly fatal, with 5 yr mortality >80%
- sudden death in young adults
- may progress to dilated cardiomyopathy

Dilated Cardiomyopathy

Definition
- unexplained dilation and impaired systolic function of one or both ventricles

Etiology
- idiopathic (presumed viral or idiopathic) ~50% of DCM
- alcohol
- familial/genetic
- uncontrolled tachycardia (e.g. persistent rapid AFib)
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever toxoplasmosis
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
- radiation

Signs and Symptoms
- may present as:
  - CHF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

Investigations
- blood work: CBC, electrolytes, Cr, bicarbonate, BNP CK, troponin, LFTs, TSH, TIBC
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (non-sustained VT)
- CXR: global cardiomegaly (globular heart), signs of CHF, pleural effusion
- echo: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in selected patients to exclude ischemic heart disease

Management
- treat underlying disease: e.g. abstinence from alcohol
- treat CHF: see Heart Failure, C34
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
- treat symptomatic or serious arrhythmias
- immunize against influenza and S. pneumoniae
- consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
- consider ICD among patients with a LVEF <30%

Prognosis
- depends on etiology
- better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
- cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in 1st yr, 10% per year after
Hypertrophic Cardiomyopathy

- see 2011 ACCF/AHA Guideline for the Diagnosis and Treatment of Hypertrophic Cardiomyopathy for details

Definition
- defined as unexplained ventricular hypertrophy
- various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

Etiology and Pathophysiology
- histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- prevalence of 1/500-1/1,000 in general population
- generally presents in early adulthood

Hemodynamic Classification
- hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
  - dynamic i.e. obstruction (and the murmur) is reduced with maneuvers that increase preload, and augmented with maneuvers that reduce preload
- non-obstructive HCM: no LVOT obstruction
- many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

Signs and Symptoms
- clinical manifestations: asymptomatic (common, therefore screening is important), SOB on exertion, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, “spike and dome” pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, ‘triple ripple’ (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLQS or apex, enhanced by squat to standing or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

Investigations
- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (leads I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR; LVOT gradient can be estimated by Doppler measurement
genetic studies (± magnetic resonance imaging) can be helpful when echocardiography is inconclusive for diagnosis
- cardiac catheterization (only when patient being considered for invasive therapy)

Management
- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of all competitive sports
- treatment of obstructive HCM
  - medical agents: β blockers, disopyramide, verapamil (started only in monitored setting), phenylephrine (in setting of cardiogenic shock)
  - avoid nitrates, diuretics, and ACEI as they increase LVOT gradient and worsen symptoms
- patients with obstructive HCM and drug-refractory symptoms
  - surgical myectomy
  - alcohol septal ablation - percutaneous Intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - dual chamber pacing (rarely done)
- treatment of patients at high risk of sudden death : ICD
- first-degree relatives (children, siblings, parents) of patients with HCM should be screened (physical, ECG, 2D echo) every 12-18 mo during adolescence, then serially every 5 yr during adulthood

Prognosis
- potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
  - major risk factors for sudden death (consider ICD placement)
  - history of survived cardiac arrest/sustained VT
  - family history of multiple premature sudden deaths
  - other factors associated with increased risk of sudden cardiac death
    - syncope (presumed to be arrhythmic in origin)
    - non-sustained VT on ambulatory monitoring
    - marked ventricular hypertrophy (maximum wall thickness ≥30 mm)
    - abnormal BP in response to exercise (in patients <40 yr old with HCM)

RCM vs. Constrictive Pericarditis (CP)
Present similarly but CP is treatable with surgery
Restrictive Cardiomyopathy

**Definition**
- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

**Etiology**
- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis, Loeffler's endocarditis, or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoïd syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

**Clinical Manifestations**
- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

**Investigations**
- ECG: low voltage, non-specific, diffuse ST-T wave changes ± non-ischemic Q waves
- CXR: mild cardiac enlargement
- Echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

**Management**
- exclude constrictive pericarditis
- treat underlying disease: control HR, anticoagulate if AFib
- supportive care and treatment for CHF, arrhythmias
- cardiac transplant: might be considered for CHF refractory to medical therapy, see Cardiac Transplantation, C38

**Prognosis**
- depends on etiology
Valvular Heart Disease

- see Guidelines on the Management of Valvular Heart Disease. JACC Jun 10;63(22):2438-88 for details

Infective Endocarditis
- see Infectious Diseases, ID16
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  • only for patients with:
    - prosthetic valve material
    - past history of IE
    - certain types of congenital heart disease
    - cardiac transplant recipients who develop valvulopathy
  • only for the following procedures:
    - dental
    - respiratory tract
    - procedures on infected skin/skin structures/MSK structures
    - not GI/GU procedures specifically

Rheumatic Fever
- see Pediatrics, P53

Prognosis
- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

Valve Repair and Valve Replacement
- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease as well as a variety of valve diseases associated with aging
- valve repair: balloon valvuloplasty, surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae shortening, tissue patch
- valve replacement: typically for aortic or mitral valves only; mitral valve repair is favoured in younger individuals; percutaneous techniques being established

Choice of Valve Prosthesis

Mitrval Valve Repair vs. Replacement for Severe Ischemic Mitral Regurgitation
NEJM 2014;370:23-32

Purpose: Ischemic mitral regurgitation is associated with significant mortality. The purpose of this study was to compare the effectiveness and safety of repairing versus replacing the mitral valve in patients with severe chronic ischemic mitral regurgitation.

Study Design: RCT with 251 patients with severe ischemic mitral regurgitation were randomly assigned to mitral valve repair or chordal-sparing replacement. The primary endpoint was the left ventricular end-systolic volume index (LVEFVR) at 12 mo.

Results: There were no significant between-group differences in LVEFVR, in the rate of major adverse cardiac or cerebrovascular events, in functional status, or in quality of life at 12 mo. The rate of moderate or severe mitral regurgitation recurrence at 12 mo was significantly higher in the repair group than in the replacement group (32.8% vs. 2.3%, respectively).

Conclusions: No significant difference in left ventricular reverse remodeling or survival at 12 mo between patients who underwent mitral valve repair or replacement. Replacement provided more durable correction of mitral regurgitation, but there were no significant differences in clinical outcomes.

Figure 41. Hemodynamics of aortic stenosis
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2.

Figure 42. Hemodynamics of aortic regurgitation
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume.

Figure 43. Hemodynamics of acute mitral regurgitation
During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end-diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP).

Figure 44. Hemodynamics of mitral stenosis
First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible.
Pericardial Disease

Acute Pericarditis

Etiology of Pericarditis/Pericardial Effusion
- idiopathic is most common: presumed to be viral
- infectious
  - viral: Coxsackie virus A, B (most common), echovirus
  - bacterial: S. pneumoniae, S. aureus
  - TB
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (sarcoid)

Signs and Symptoms
- diagnostic triad: chest pain, friction rub and ECG changes (diffuse ST elevation and PR depression with reciprocal changes in aVR)
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi-, or triphasic; evanescent and rare
- ± fever, malaise

Investigations
- ECG: initially diffuse elevated ST segments ± depressed PR segment, the elevation in the ST segment is concave upwards → 2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- Echo: performed to assess for pericardial effusion

Treatment
- treat the underlying disease
- anti-inflammatory agents (high dose NSAIDs/ASA, steroids use controversial), analgesics

Complications
- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

Pericardial Effusion

Etiology
- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

Signs and Symptoms
- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant "x" descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds ± rub
- Ewart's sign

Investigations
- ECG: low voltage, flat T waves, electrical alternans (classic, but not sensitive to exclude effusion)
  - be cautious in diagnosing STEMI in a patient with pericarditis and an effusion - antiplatelets may precipitate hemorrhagic effusion
- CXR: cardiomegaly, rounded cardiac contour
- ER: bedside ultrasound with subxiphoid view showing fluid in pericardial sac
- Echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement
Pericardial Disease

C48  Cardiology and Cardiac Surgery

Toronto Notes 2018

Treatment
• mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
• severe: treat as in tamponade (see Cardiac Tamponade)

Cardiac Tamponade

Etiology
• major complication of rapidly accumulating pericardial effusion
• cardiac tamponade is a clinical diagnosis
• any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

Pathophysiology
• high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

Signs and Symptoms
• tachypnea, dyspnea, shock, muffled heart sounds
• pulsus paradoxus (inspiratory fall in systolic BP >10 mmHg during quiet breathing)
• JVP “x” descent only, blunted “y” descent
• hepatic congestion/peripheral edema

Investigations
• ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
• echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
• cardiac catheterization

Treatment
• pericardiocentesis: Echo-guided
• pericardiotomy
• avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO)
• IV fluid may increase CO
• treat underlying cause

Constrictive Pericarditis

Etiology
• chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
• any cause of acute pericarditis may result in chronic pericarditis
• major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

Signs and Symptoms
• dyspnea, fatigue, palpitations
• abdominal pain
• may mimic CHF (especially right-sided HF)
  • ascites, hepatosplenomegaly, edema
• increased JVP, Kussmaul's sign (paradoxic increase in JVP with inspiration), Friedreich's sign (prominent “y” descent)
• BP usually normal (and usually no pulsus paradoxus)
• precordial examination: ± pericardial knock (early diastolic sound)
• see Table 17 for differentiation from cardiac tamponade

Investigations
• ECG: non-specific – low voltage, flat T wave, ± AFib
• CXR: pericardial calcification, effusions
• echo/CT/MRI: pericardial thickening, ± characteristic echo-Doppler findings
• cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

Treatment
• medical: diuretics, salt restriction
• surgical: pericardectomy (only if refractory to medical therapy)
• prognosis best with idiopathic or infectious cause and worst in post-radiation; death may result from heart failure

Classic Quartet of Tamponade
• Hypotension
• Increased JVP
• Tachycardia
• Pulsus paradoxus

Beck's Triad
• Hypotension
• Increased JVP
• Muffled heart sounds

DDx Pulsus Paradoxus
• Constrictive pericarditis (rarely)
• Severe obstructive pulmonary disease (e.g. asthma)
• Tension pneumothorax
• PE
• Cardiogenic shock
• Cardiac tamponade

</tr>
<tr>
<td>ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)</td>
<td>candesartan, irbesartan, valsartan</td>
<td>Block AT II receptors, causing similar effects to ACEI</td>
<td>Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated</td>
<td>Same as ACEI</td>
<td>Similar to ACEI, but do not cause dry cough</td>
</tr>
<tr>
<td>DIRECT RENIN INHIBITORS (DRIs)</td>
<td>aliskiren</td>
<td>Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II</td>
<td>HTN (exact role of this drug remains unclear)</td>
<td>Pregnancy, severe renal impairment</td>
<td>Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure</td>
</tr>
<tr>
<td>β-BLOCKERS</td>
<td>atenolol, metoprolol, bisoprolol</td>
<td>Block β-adrenergic receptors, decreasing HR, BP contractility, and myocardial oxygen demand, slow conduction through the AV node</td>
<td>HTN, CAD, acute MI, post-MI, CHF (start low and go slow), Afib, SVT</td>
<td>Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW. Caution in asthma, claudication, Raynaud’s phenomenon and desensitization of CHF</td>
<td>Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud’s phenomenon and claudication</td>
</tr>
<tr>
<td>CAUCIAL CHANNEL BLOCKERS (CCBs)</td>
<td>diltiazem</td>
<td>Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers Also vasodilate</td>
<td>HTN, CAD, SVT, diastolic dysfunction</td>
<td>Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW, CHF</td>
<td>Hypotension, bradycardia, edema Negative inotrope</td>
</tr>
<tr>
<td>Phenylalkylamines (non-dihydropyridines)</td>
<td>amlodipine (Norvasc®), nifedipine (Adalat®), felodipine (Plendil®)</td>
<td>Block smooth muscle calcium channels causing peripheral vasodilation</td>
<td>HTN, CAD</td>
<td>Severe aortic stenosis and liver failure</td>
<td>Hypotension, edema, flushing, headache, light-headedness</td>
</tr>
<tr>
<td>Dihydropyridines</td>
<td>hydrochlorothiazide, chlorothalidone, metolazone</td>
<td>Reduce Na⁺ reabsorption in the distal convoluted tubule (DCT)</td>
<td>HTN (drugs of choice for uncomplicated HTN)</td>
<td>Sulfa allergy, pregnancy</td>
<td>Hypotension, hypokalemia, polyuria</td>
</tr>
<tr>
<td>Loop diuretics</td>
<td>furosemide (Lasix®)</td>
<td>Blocks Na⁺/K⁺/ATPase in thick ascending limb of the loop of Henle</td>
<td>CHF, pulmonary or peripheral edema</td>
<td>Hypovolemia, hypokalemia</td>
<td>Hypovolemia, hypokalemic metabolic alkalosis</td>
</tr>
<tr>
<td>Aldosterone receptor antagonists</td>
<td>spironolactone, eplerenone</td>
<td>Antagonize aldosterone receptors</td>
<td>HTN, CHF, hypokalemia</td>
<td>Renal insufficiency, hypokalemia, pregnancy</td>
<td>Edema, hyperkalemia, gynecomastia</td>
</tr>
<tr>
<td>DIURETICS</td>
<td>digoxin (Lanoxin®)</td>
<td>Inhibit Na⁺/K⁺/ATPase, leading to increased intracellular Na⁺ and Ca²⁺ concentration and increased myocardial contractility Also slows conduction through the AV node</td>
<td>CHF AFib</td>
<td>2nd or 3rd degree AV block, hypokalemia, WPW</td>
<td>AV block, tachyarrhythmias, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V</td>
</tr>
<tr>
<td>INOTROPES</td>
<td></td>
<td></td>

</thead>
<tbody>
<tr>
<td><strong>ANTICOAGULANTS</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Coumarins</td>
<td>warfarin (Coumadin®)</td>
<td>Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X</td>
<td>Atrial fibrillation, left ventricular dysfunction, prosthetic valves</td>
<td>Recent surgery or bleeding, bleeding diathesis, pregnancy</td>
<td>Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis</td>
</tr>
<tr>
<td>Heparins</td>
<td>Unfractionated heparin</td>
<td>Antithrombin III agonist, leading to decreased clotting factor activity</td>
<td>Acute MI or ACS; when immediate anticoagulant effect needed</td>
<td>Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs)</td>
<td>Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs)</td>
</tr>
<tr>
<td>Direct thrombin inhibitors</td>
<td>dabigatran, melagatran</td>
<td>Competitive, direct thrombin inhibitor; thrombin enables fibrinogen conversion to fibrin during the coagulation cascade, thereby preventing thrombus development</td>
<td>Atrial fibrillation</td>
<td>Severe renal impairment, recent surgery, active bleeding</td>
<td>Bleeding, GI upset</td>
</tr>
<tr>
<td><strong>ANTIPLATELETS</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Salicylates</td>
<td>ASA (Aspirin®)</td>
<td>Irreversibly acetylates platelet COX-1 preventing thromboxane A2-mediated platelet aggregation</td>
<td>Coronary artery disease, acute MI, post-MI, post-PCI, CABG</td>
<td>Active bleeding or PUD</td>
<td>Bleeding, GI upset, ulceration, impaired renal perfusion</td>
</tr>
<tr>
<td>Thienopyridines</td>
<td>clopidogrel (Plavix®), ticlopidine (Ticlid®), prasugrel (Effient®)</td>
<td>P2Y12 antagonist (block platelet ADP receptors)</td>
<td>Acute MI, post-MI, post-PCI, CABG</td>
<td>Active bleeding or PUD</td>
<td>Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine)</td>
</tr>
<tr>
<td>Nucleoside analogues</td>
<td>ticagrelor (Brilinta®)</td>
<td>P2Y12 antagonist (but different binding site than thienopyridines)</td>
<td>Acute MI, particularly if PCI is planned</td>
<td>Recent surgery or bleeding, bleeding diathesis</td>
<td>Bleeding</td>
</tr>
<tr>
<td>GPIIb/IIIa inhibitors</td>
<td>eptifibatide, tirofiban, abciximab</td>
<td>Block binding of fibrinogen to Gp IIb/IIIa</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>THROMBOLYTICS</strong></td>
<td>alteplase, reteplase, tenecteplase, streptokinase</td>
<td>Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin</td>
<td>Acute STEMI</td>
<td>See Table 8, C29</td>
<td>Bleeding</td>
</tr>
<tr>
<td><strong>NITRATES</strong></td>
<td>nitroglycerin</td>
<td>Relax vascular smooth muscle, producing venous and arteriolar dilation</td>
<td>Coronary artery disease, CHF (isosorbide dinitrate plus hydralazine)</td>
<td>Concurrent use of cGMP phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure</td>
<td>Headache, dizziness, weakness, postural hypotension</td>
</tr>
<tr>
<td><strong>LIPID LOWERING AGENTS</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Statins</td>
<td>atorvastatin (Lipitor®), pravastatin (Pravachol®), rosuvastatin (Crestor®), simvastatin (Zocor®), lovastatin (Mevacor®)</td>
<td>Inhibit HMG-CoA reductase, which catalyzes the rate-limiting step in cholesterol synthesis</td>
<td>Dyslipidemia (1st prevention of CAD), CAD, post-MI (2nd prevention of CV events)</td>
<td>Liver or muscle disease</td>
<td>Myalgia, rhabdomyolysis, abdominal pain</td>
</tr>
<tr>
<td>Cholesterol absorption inhibitor</td>
<td>ezetimibe (Zetia®)</td>
<td>Inhibits gut absorption of cholesterol</td>
<td>Decreases LDL but does not reduce mortality</td>
<td>Liver or renal impairment</td>
<td>Myalgia, rhabdomyolysis, abdominal pain</td>
</tr>
<tr>
<td>Miscellaneous</td>
<td>fibrates, bile acid sequestrates, nicotinic acid</td>
<td>Primarily in familial hypercholesterolemia</td>
<td></td>
<td></td>
<td>GI side effects common</td>
</tr>
<tr>
<td>Investigational</td>
<td>PSCK9 inhibitor</td>
<td>Monoclonal antibody</td>
<td></td>
<td>Hypercholesterolemia</td>

### Landmark Cardiac Trials

#### ISCHEMIC HEART DISEASE

<table>
<thead>
<tr>
<th>Trial</th>
<th>Reference</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCOT-LLA</td>
<td>Lancet 2003;361:1149-58</td>
<td>In hypertensive patients with risk factors for CHD and average or below-average cholesterol, atorvastatin reduced nonfatal MI, fatal CHD, fatal/nonfatal stroke, coronary events but not all-cause mortality</td>
</tr>
<tr>
<td>CAPRIE</td>
<td>Lancet 1996;348:1329-39</td>
<td>In atherosclerotic vascular disease, clopidogrel reduced the primary combined endpoint of stroke, MI, or vascular death and improved PAD compared to ASA</td>
</tr>
<tr>
<td>CARE</td>
<td>NEJM 1996;335:1001-9</td>
<td>Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol</td>
</tr>
<tr>
<td>COURAGE</td>
<td>NEJM 2007;356:1503-16</td>
<td>Compared with optimal medical therapy alone, PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events</td>
</tr>
<tr>
<td>CURE</td>
<td>NEJM 2001;345:494-502</td>
<td>Clopidogrel plus ASA reduced death from CV causes, non fatal MI, or stroke but increased bleeding complications</td>
</tr>
<tr>
<td>EUROPA</td>
<td>Lancet 2003;362:782-88</td>
<td>With stable CAD and no CHF, perindopril reduced cardiovascular death, MI, and total mortality</td>
</tr>
<tr>
<td>HOPE</td>
<td>NEJM 2000;342:154-60</td>
<td>In high-risk patients without low LVEF or CHF, ramipril reduced rates of death, MI, stroke, revascularization, new diagnosis of DM and complications due to DM; vitamin E had no effect on outcomes</td>
</tr>
<tr>
<td>HPS</td>
<td>Lancet 2002;360:7-22</td>
<td>In high-risk patients with various cholesterol values, simvastatin reduced all-cause mortality, coronary deaths, and major vascular events</td>
</tr>
<tr>
<td>INTERHEART</td>
<td>Lancet 2004;364:937-52</td>
<td>Nine modifiable risk factors account for 90% of myocardial infarction</td>
</tr>
<tr>
<td>JUPITER</td>
<td>NEJM 2008;359:2195-2207</td>
<td>With low to normal LDL-C and elevated hsCRP treatment with rosuvastatin significantly reduced major cardiovascular events; NNT with rosuvastatin for 2 yr to prevent one primary endpoint = 95</td>
</tr>
<tr>
<td>SYNTAX</td>
<td>NEJM 2009;360:961-972</td>
<td>CABG has lower rate of ma or cardiac or cerebrovascular events; the rate of stroke was increased with CABG, whereas the rate of repeat revascularization was increased with PCI</td>
</tr>
<tr>
<td>TNT</td>
<td>NEJM 2005;352:1425-35</td>
<td>Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d</td>
</tr>
<tr>
<td>WHI</td>
<td>JAMA 2002;288:321-333</td>
<td>Estrogen plus progestin therapy is associated with increased risks of cardiovascular disease and breast cancer but decreased risks of hip fracture and colorectal cancer in postmenopausal women</td>
</tr>
</tbody>
</table>

#### MYOCARDIAL INFARCTION

<table>
<thead>
<tr>
<th>Trial</th>
<th>Reference</th>
<th>Results</th>

### General Principles

#### Drug Nomenclature

- **chemical name**: describes chemical structure; consistent in all countries (e.g. N-(4-hydroxyphenyl)acetamide is acetaminophen)
- **DIN or NDC**: DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name**: approved name (post-phase III trial), official name (listed in pharmacopeia), or generic name (off-patent) such as acetaminophen
- **proprietary (trade) name**: the brand name or registered trademark (e.g. Tylenol®)

### Phases of Clinical Drug Testing

- **pre-clinical**: testing a drug in a controlled environment (lab) on animal or human cells before human testing to discern the PK and toxicological profile
- **phase I**: first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II**: first administration to patients, small sample sizes; to determine initial safety and efficacy, dose range, PK, and PD
- **phase III**: large sample sizes, often double-blinded RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV**: post-marketing surveillance, wide distribution; to determine effects of long-term use, rare ADRs, ideal dosing, and effects in real-world practice

### Drug Administration

- choice of route of administration depends on: drug properties, local and systemic effects, desired onset and/or duration of action, and patient characteristics

**Table 1. Routes of Drug Administration**

<table>
<thead>
<tr>
<th>Route</th>
<th>Advantage</th>
<th>Disadvantage</th>

</tbody>
</table>
Pharmacokinetics

- **study of “what the body does to a drug”**
- **definition**: relationship between drug administration, time-course/rate of absorption and distribution, concentration changes in the body compartments, and the drug’s removal from the body

## Absorption

- **definition**: movement of the drug from the site of administration into plasma

### Mechanisms of Drug Absorption

- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms include active transport, facilitated diffusion, and pinocytosis/phagocytosis

### Factors Affecting the Rate and Extent of Drug Absorption

- **P<sub>ow</sub>**
  - local blood flow at the site of administration (e.g. sublingual vessels facilitate rapid absorption of sublingual medications)
- **molecular size** (e.g. drugs with smaller molecular weight absorb faster)
- **pH and drug ionization**
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms
  - non-ionized forms cross cell membranes much faster than ionized (charged) forms
  - the ratio of ionized to non-ionized forms is determined by body compartment pH and drug pKa (HH equation)
- total surface area for absorption
- small intestinal villi are the primary site of absorption for most oral drugs

Bioavailability (F)

- **definition**: proportion of dose that reaches systemic circulation in an unchanged state
- decreased by limited drug absorption or first-pass effect
- IV dose has 100% bioavailability (F = 1)

### First-Pass Effect

- **definition**: drug metabolism by the liver and/or the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- occurs less with PR administration because drug absorbed in colon bypasses the portal system

### Efflux Pump

- Pgp is a protein found in various parts of the body that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- for example, opposes intestinal absorption (e.g. dabigatran etexilate) and also enhances renal elimination of certain drugs (e.g. digoxin, etoposide, paclitaxel, tacrolimus, cyclosporine)
- some drugs (e.g. macrolide antibiotics) inhibit Pgp function, leading to increased serum levels of drugs transported by Pgp. Pgp inducers (e.g. St. John’s wort) do the opposite
- some tumours overexpress Pgp leading to multidrug resistance to chemotherapeutic agents

## Distribution

- **definition**: movement of drugs between different body compartments and to the site of action

### Factors Affecting the Rate and Extent of Drug Distribution

- physiochemical properties of the drug (e.g. P<sub>ow</sub> and pKa)
- pH of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow

---

**Figure 1. Distribution of total body water (TBW)**

- **Total Body Water**: 60% of body weight
- **Extracellular Fluid**: 16-20%
- **Intercellular Fluid**: 40-44%
- **Intravascular Plasma**: 4%
- **Interstitial Fluid**: 12-15%
Volume of Distribution

- $V_d$ the apparent volume of fluid into which a drug distributes
- maximum actual $V_d$ (anatomic fluid volume accessible to drug) = TBW (TBW~40 L for average adult)
  - a calculated value $(V_d) = \text{amount of drug in body} ÷ \text{plasma drug concentration}$
  - a theoretical value that does not correspond to an anatomic space (i.e. can exceed TBW)
  - small $V_d$ corresponds to a drug that concentrates in plasma and/or binds plasma proteins to a high degree
  - large $V_d$ corresponds to a drug that distributes into tissues (fat, muscle, etc.); most is not in blood (measured space).
  - it therefore “appears” to distribute in a large volume
- $V_d$ of plasma protein bound drugs can be altered by liver and kidney disease
- example: amiodarone distributes into TBW (actual $V_d = 40$ L), but it also concentrates in fat tissues giving instead a large apparent $V_d$ of 400 L; therefore, to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

 Plasma Protein Binding

- drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to α1-acid glycoprotein
  2. free or unbound: can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
  - bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
  - reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often metabolized with no harmful effects, although toxicity is possible

Depots

- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wk)

 Barriers (relative)

- body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. Pgp), which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers

Metabolism (Biotransformation)

- definition: chemical transformation of a drug in vivo to enhance elimination
- sites of biotransformation include liver (main), GI tract, lung, plasma, kidney
- as a result of the process of biotransformation:
  - an inactive prodrug may be activated (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be changed to another active metabolite (e.g. diazepam to oxazepam)
  - a drug may be changed to a toxic metabolite (e.g. meperidine to normeperidine)
  - a drug may be inactivated (most drugs)

Drug Metabolizing Pathways

- phase I (P450) reactions
  - minor molecular changes introduce or unmask polar groups on a parent compound to increase water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation); the change in $P_{ow}$ is typically minimal compared to phase II, and often phase I places a polar ‘handle’ on a lipophilic drug to allow for phase II
  - mediated by CYPs found in the endoplasmic reticulum
  - product of the reaction can be excreted or undergo further phase II reactions
- phase II (conjugation) reactions
  - conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
  - dramatically increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. glucuronides of morphine)
  - can occur independently of phase I reactions
Factors Affecting Drug Biotransformation

- **genetic polymorphisms** of metabolizing enzymes
  - individual genotypes may determine rate of drug metabolism (e.g. poor, intermediate, extensive, or ultrarapid metabolizers)
  - may lead to toxicity or ineffectiveness of a drug at a normal dose
  - tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas overactive/duplicated alleles impart “ultrarapid metabolizer” phenotype)
  - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to greater effect and lower dose requirements)
- **enzyme inhibition** may sometimes be due to other drugs
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin [CYP3A4 inhibitor] can predispose patients to simvastatin toxicity [metabolized by CYP3A4])
- **enzyme induction**
  - certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCPs) by inducing the CYP system
- **liver dysfunction** (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver's reserve capacity
- **renal disease** often results in decreased drug clearance
- **extremes of age** (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly
- **nutrition**: insufficient protein and fatty acid intake decreases CYP biotransformation, and vitamin/mineral deficiencies may also impact other metabolizing enzymes
- **alcohol**: while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase risk of hepatocellular damage from acetaminophen by increasing the generation of acetaminophen's toxic metabolite
- **smoking** can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, antipsychotics)

**Elimination**

- **definition**: removal of drug from the body

**Routes of Drug Elimination**

- **kidney** (main organ of elimination)
  - two mechanisms:
    1. **glomerular filtration**
       - a passive process, so that only the free drug fraction can be eliminated
       - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
    2. **tubular secretion**
       - an active process that is saturable allowing both protein-bound and free drug fractions to be excreted
       - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
       - drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can reduce the excretion of penicillin)
- **tubular reabsorption**: drugs can be passively reabsorbed back to the systemic circulation, countering elimination mechanisms
- **renal function** (assessed using serum Cr levels) decreases with age and is affected by many disease states such as diabetes
- **stool**: some drugs and metabolites are actively excreted in the bile or directly into the GI tract
  - enterohepatic reabsorption counteracts stool elimination, and can prolong the drug's duration in the body
  - some glucuronide conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed
- **lungs**: elimination of anesthetic gases and vapours by exhalation
- **saliva**: saliva concentrations of some drugs parallel their plasma levels (e.g. rifampin)

**Cytochrome P450 System**

The CYPs are a superfamily of heme proteins that are grouped into families and subfamilies according to their amino acid sequence. These proteins are responsible for the metabolism of drugs, chemicals, and other substances.

**Nomenclature:** CYP = cytochrome P450 protein
- 1st number = family
- letter = subfamily
- 2nd number = isoform

The CYP1, CYP2, and CYP3 families metabolize most drugs in humans. The most important isoforms are CYP3A4 and CYP2D6; therefore, anticipate drug interactions if prescribing drugs using these enzymes.

**Examples of CYP Substrates, Inhibitors and Inducers**

http://www.medicine.iupui.edu/CLINPHARM/ddis/main-table

**The Cockcroft-Gault Equation can Estimate CrCl in Adults 20 yr of Age and Older**

- For males
  \[
  \text{CrCl (mL/min)} = \left( \frac{140 - \text{age in yr}}{\text{Wt} \times 1.2} \right) \times \text{serum Cr (µmol/L)}
  \]
- For females, multiply above equation x 0.85

Note, only applies when renal function is at steady state.

Avoid toxicity from drug or metabolite accumulation by adjusting a drug’s dosage according to the elimination characteristics of the patient.
Pharmacokinetic Calculation

- **definition:** the quantitative description of the rates of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on a concentration vs. time graph

**Time Course of Drug Action**
- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a log10 concentration to allow for easier mathematical calculations
- drugs such as warfarin can exhibit hysteresis (for a single drug concentration, there may be two different response levels)

**Half-Life**
- **definition:** time taken for the serum drug level to fall 50% during elimination
- drugs with first order kinetics require five half-lives to reach steady state with repeated dosing or for complete drug elimination once dosing is stopped

**Steady State**
- drug concentration remains constant when amount of drug entering the system is eliminated from the system
- drug levels in therapeutic drug monitoring are of greatest utility when the steady state has been reached
  - special situations
    - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
    - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, insulin, unfractionated heparin)

**Clearance**
- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
  - CI = rate of elimination of drug/plasma drug concentration
- must consider CI from a specific part of the body and total body CI

**Elimination Kinetics**
- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the CI is less than would be predicted for a given concentration
  - shows linear relationship when plotted to a log (concentration) vs. time graph
- zero-order kinetics (less common, associated with overdose, e.g. alcohol)
  - drug is eliminated at a constant rate regardless of concentration; concept of half-life does not apply
  - the concentration axis is converted to a log (concentration) to allow for easier mathematical calculations

**Table 2. Half-Life**

Pharmacodynamics

• study of “what the drug does to the body”

Dose-Response Relationship

• graded dose-response relationships: relates dose to intensity of effect

Efficacy

• the maximum biological response produced by a drug
• measured by E_{max} (the maximal response that a drug can elicit in a RCT or under optimal circumstances)

Potency

• measured by EC_{50} (the concentration of a drug needed to produce 50% of E_{max})
• a drug that reaches its EC_{50} at a lower dose is more potent

Figure 5. Log(dose)-response curve illustrating efficacy and potency

Effects of Drugs on Receptors

Agonists

• drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  • affinity: the ability of the agonist to bind to the receptor (e.g. the β2-agonist salbutamol has greater affinity for β2-receptors than β1-receptors)
  • efficacy: the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to β2-receptors results in smooth muscle relaxation)
  • full agonists: can elicit a maximal effect at a receptor
  • partial agonists: can only elicit a partial effect, no matter the concentration at the receptor (i.e. reduced efficacy compared to full agonists)

Antagonists

• drugs that block the action of an agonist or of an endogenous ligand
  • chemical antagonism: direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
  • functional antagonism: two agonists that act independently at different receptors and have opposite physiological effects (e.g. acetylcholine at the muscarinic receptor compared to epinephrine at the adrenergic receptor)
  • reversible and irreversible competitive antagonism
    • drugs that exert no direct effect upon binding to a given receptor
    • reversible competitive antagonists reversibly bind to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)
    • irreversible antagonists form a covalent bond with the receptor, thus irreversibly blocking substrates from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
  • non-competitive antagonism
    • antagonist binds to an alternate site near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)

Efficacy vs. Potency

• Efficacy measures the maximal effect of a drug
• Potency measures the concentration of a drug needed to produce a certain effect

Figure 6. The log(dose)-response curve for competitive reversible antagonism

Figure 7. The log(dose)-response curve for irreversible antagonism
Effectiveness and Safety

Effectiveness
- **ED50** (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

Safety
- **LD50** (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- **TD50** (toxic dose): the dose needed to cause a harmful effect in 50% of a test population of subjects

Therapeutic Indices

Therapeutic Index: **TD50/ED50**
- reflects the “margin of safety” for a drug – the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer a drug (e.g. warfarin has a narrow TI and requires drug monitoring)
- factors that can change the TI
  - presence of interacting drugs
  - changes in drug ADME

Certain Safety Factor: **TD1/ED99**
- >1 translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population

Drugs with a narrow TI have a high likelihood of causing toxicity and need close therapeutic monitoring

The two most clinically relevant properties of any drug are effectiveness and safety
Therapeutic Drug Monitoring

• Definition: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance) serum drug samples are usually taken when the drug has reached steady state (after approximately 5 half-lives)

• TDM is often used for drugs that have: narrow TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and wide inter-patient PK variability

Adverse Drug Reactions

Table 4. Characteristics of Type A-E Adverse Drug Reactions

<table>
<thead>
<tr>
<th>Classification</th>
<th>Definition</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>A (Augmented)</td>
<td>Dose related</td>
<td>Predictable extension of drug’s pharmacologic effect (e.g. β-blockers causing bradycardia) &gt;80% of all ADRs</td>
</tr>
<tr>
<td>B (Bizarre)</td>
<td>Non-dose related</td>
<td>Reactions unrelated to the known pharmacological actions of the drug Examples include: drug hypersensitivity syndromes, immunologic reactions (penicillin hypersensitivity), and idiosyncratic reactions (malignant hyperthermia)</td>
</tr>
<tr>
<td>C (Chronic)</td>
<td>Dose and time related</td>
<td>Related to cumulative doses Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates)</td>
</tr>
<tr>
<td>D (Delayed)</td>
<td>Time related</td>
<td>Occurs some time after use of drug (e.g. carcinogen) May also be dose-related</td>
</tr>
<tr>
<td>E (End of use)</td>
<td>Withdrawal</td>
<td>Occurs after cessation of drug use (e.g. opiate withdrawal)</td>
</tr>
</tbody>
</table>

Approach to Suspected Adverse Drug Reactions

• History and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again)

• Differentiate between drug therapy vs. disease pathophysiology

• Treatment: stop the drug, supportive care, symptomatic relief

• Resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-888-268-9017) if overdose or poisoning suspected; check with Motherisk (www.motherisk.org) in cases involving pregnant or breastfeeding women

• Report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
  - Canadian Adverse Drug Reaction Monitoring Program available for online reporting
Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
- possible causes of individual variability in drug response include problems with:
  - intake: patient adherence
  - PK
  - absorption: vomiting, diarrhea, or steatorrhea; first pass effect increased due to enzyme induction or decreased due to liver disease
  - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones)
  - distribution: very high or low percentage body fat; intact or disrupted BBB; patient is elderly or a neonate, or has liver dysfunction
  - biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism); kidney or liver dysfunction
  - PD: genetic variability in drug response (e.g. immune-mediated reactions); diseases that affect drug PD; drug tolerance or cross-tolerance

Drug Interactions

- concomitant prescriptions: one drug alters the effect of another by changing its PK and/or PD
- PK interactions involve changes in drug concentration
  - absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut transporters
  - metabolism: alterations in drug metabolizing enzymes (e.g. CYP)
  - excretion: alterations in renal elimination
- PD interactions are due to two drugs that exert similar effects (additive) or opposing effects (subtractive)
- drug interactions can also involve herbal medications (e.g. St. John’s wort) and food (e.g. grapefruit)

Autonomic Pharmacology

- most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see Neurology, N8)
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to cholinergic receptors, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which principally include β1, β2, α1, and α2
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
- acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer’s disease
- NE action is terminated by reuptake at the presynaptic membrane, diffusion from the synaptic cleft and degradation at monoamine oxidase (MAO) and catechol-O-methyl transferase (COMT)

Parasympathetic Nervous System

- blood vessels, adrenals, sweat glands, spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4 and connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ
- post-ganglionic fibres connect with effector tissues via:
  - M1 muscarinic receptors located in the CNS
  - M2 muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium
**Sympathetic Nervous System**

- sympathetic pre-ganglionic fibres originate in the spinal cord at spinal levels T1-L2/L3
- pre-ganglionic fibres connect with post-ganglionic fibres via nicotinic receptors located in one of two groups of ganglia:
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via:
  - β1 receptors in cardiac tissue
  - β2 receptors in smooth muscle of bronchi and GI tract
  - α1 receptors in vascular smooth muscle
  - α2 receptors in vascular smooth muscle
  - M3 muscarinic receptors located in sweat glands

**Opioid Therapy and Chronic Non-Cancer Pain**

**Who?**

- for patients without current or past substance use disorder and without other active psychiatric disorders, who have persistent problematic pain despite optimized non-opioid therapy, add a trial of opioids rather than continued therapy without opioids (weak recommendation)
- for patients with an active substance use disorder, use of opioids is not recommended (strong recommendation)
- for patients with chronic non-cancer pain with a history of substance use disorder, whose non-opioid therapy has been optimized, and who have persistent problematic pain, continue non-opioid therapy rather than a trial of opioids (weak recommendation)
- for patients with an active psychiatric disorder whose non-opioid therapy has been optimized, and who have persistent problematic pain, stabilize the psychiatric disorder before a trial of opioids is considered (weak recommendation)

**General Management Principles**

- when first considering therapy for patients with chronic non-cancer pain, optimize non-opioid pharmacotherapy and non-pharmacologic therapy, rather than a trial of opioids (strong recommendation)
- for patients with chronic non-cancer pain beginning opioid therapy, restrict the prescribed dose to less than 90 mg morphine equivalents daily, rather than having no upper limit or a higher limit on dosing (strong recommendation)
- for patients with chronic non-cancer pain who are currently using 90 mg morphine equivalents of opioids per day or more, taper opioids to the lowest effective dose, potentially including discontinuation, rather than making no change in opioid therapy (weak recommendation)
- for patients with chronic non-cancer pain who are beginning opioid therapy, restrict the prescribed dose to less than 50 mg morphine equivalents daily (weak recommendation)
- for patients with chronic non-cancer pain who are currently using opioids, and have persistent problematic pain and/or problematic adverse effects, rotate to other opioids rather than keeping the opioid the same (weak recommendation)
- for patients with chronic non-cancer pain who are using opioids and experiencing serious challenges in tapering, formal multidisciplinary program is suggested (strong recommendation)
# Common Drug Endings

Acronyms

Skin Anatomy

Skin
- divided anatomically into epidermis, dermis, and subcutaneous tissue
- **epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules which characterize skin
    - stratum lucidum: transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
  - cells of the epidermis
    - keratinocytes: located in all layers of the epidermis, except the stratum corneum; connected to each other by desmosomes
    - melanocytes: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produce melanosomes containing melanin, which are transferred to keratinocytes
    - Langerhans cells: dendritic cells which are important for immune surveillance
    - Merkel cells: located in the basal layer; involved in touch sensation
- **dermis**: comprises of connective tissue divided into two regions
  - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
  - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
- **cells of dermis**
  - fibroblasts: produce collagen, elastin, and ground substance
  - mast cells: release histamines which mediate type 1 hypersensitivity
  - other components of dermis include: blood vessels, nerves, pilosebaceous units, and sweat glands
- **subcutaneous tissue** (hypodermis)
  - consists primarily of adipose cells, larger calibre vessels, nerves, and fascia
Epidermal Appendages
- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

Cutaneous Glands
- sebaceous gland: part of pilosebaceous unit, produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- apocrine sweat gland: apocrine duct empties into hair follicle above sebaceous gland
  - found in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- eccrine sweat gland: not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

Skin Function
- protection
  - due to continuous recycling and avascularity of epidermis
  - barrier to UV radiation (melanin), mechanical/chemical insults (sensory/mechanoreceptors), pathogens (immune cells), and dehydration (lipid rich barrier)
- thermal regulation
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- sensation
  - touch, pain, and temperature sensation
- metabolic function
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

Definitions

Primary Morphological Lesions
Definition
- an initial lesion that has not been altered by trauma or manipulation, and has not regressed

Table 1. Types of Primary Morphological Lesions

<table>
<thead>
<tr>
<th>Profile</th>
<th>&lt;1 cm Diameter</th>
<th>≥1 cm Diameter</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Elevated Fluid-Filled Lesion</td>
<td>Vesicle (e.g. HSV)</td>
<td>Bulla (e.g. bullous pemphigoid)</td>
</tr>
</tbody>
</table>

Secondary Morphological Lesions
Definition
- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- crust: dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- scale: excess keratin (e.g. seborrheic dermatitis)
- lichenification: thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- fissure: a linear slit-like cleavage of the skin
- excoriation: a scratch mark
- erosion: a disruption of the skin involving the epidermis alone; heals without scarring
- ulcer: a disruption of the skin that extends into the dermis or deeper; may heal with scarring
- xerosis: pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes (xerostomia)
- atrophy: histological decrease in size or number of cells or tissues, resulting in thinning or depression of the skin
Other Morphological Lesions

- **cyst**: an epithelial-lined collection containing semi-solid or fluid material
- **pustule**: an elevated lesion containing purulent fluid (white, grey, yellow, green)
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheal**: a special form of papule or plaque that is transient (<24 h) and blanchable, often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedone**: a special collection of sebum and keratin
  - open comedo (blackhead)
  - closed comedo (whitehead)
- **petechiae**: pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechia, 3 mm-1 cm in size
- **ecchymosis**: larger than purpura, >1 cm in size (i.e. a "bruise")
- **telangiectasia**: dilated superficial blood vessels; blanchable, reticulated, and of small calibre, can be associated with benign or malignant entities

Patterns and Distribution

- **acral**: relating to the hands and feet (e.g. perniosis, secondary syphilis)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a "drop-like" pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: i.e. isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo)
- **morbilliform**: literally means "measles-like", an eruption composed of macules and papules with truncal predominance
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: small lesions scattered around the periphery of a larger lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. erythema multiforme)
- **other descriptive terms**: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)

### Common Skin Lesions

#### Cysts

**Table 3. Cysts**

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Clinical Course</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Epidermal Cyst</td>
<td>Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic</td>
<td>Most common cutaneous cyst in youth – middle age</td>
<td>Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Can increase in size and number over time</td>
<td>No treatment, Elective excision</td>
</tr>
<tr>
<td>Pilar Cyst (Trichilemmal)</td>
<td>Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin</td>
<td>2nd most common cutaneous cyst F&gt;M</td>
<td>Rupture causes pain and inflammation</td>
<td>No treatment, Elective excision</td>
</tr>
<tr>
<td>Dermoid Cyst</td>
<td>Rare congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin</td>
<td>Rare</td>
<td>If nasal midline, risk of extension into CNS</td>
<td>No treatment, Elective excision</td>
</tr>
<tr>
<td>Ganglion Cyst</td>
<td>Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthritis</td>
<td>Older age</td>
<td>Stable</td>
<td>No treatment Incision and expression of contents Elective excision</td>
</tr>
<tr>
<td>Milium</td>
<td>Small epidermoid cyst, primarily ar singing from pluripotential cells in epidermal or adnexal epithelium Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures</td>
<td>Any age 40-50% of infants</td>
<td>In newborns, spontaneously resolves in first 4 wk of life</td>
<td>No treatment Incision and expression of contents Electrodessication Topical retinoid therapy</td>
</tr>
</tbody>
</table>
Fibrous Lesions

DERMATOFIGIBROMA

Clinical Presentation
- button-like, firm dermal papule or nodule, skin-coloured to red-brown
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign (Fitzpatrick’s sign): lateral compression causes dimpling of the lesion

Pathophysiology
- benign tumour due to fibroblast proliferation in the dermis

Etiology
- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibroma can be associated with SLE

Epidemiology
- adults, F>M

Differential Diagnosis
- dermatofibrosarcoma protuberans, malignant melanoma, Kaposi’s sarcoma, blue nevus

Investigations
- biopsy if diagnosis is uncertain

Management
- no treatment required
- excision if bothersome

SKIN TAGS

Clinical Presentation
- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axil, inframammary, and groin

Pathophysiology
- benign outgrowth of skin

Epidemiology
- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

Differential Diagnosis
- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC)

Management
- excision, electrodessication, cryosurgery

Hyperkeratotic Lesions

SEBORRHEIC KERATOSIS

Clinical Presentation
- known as ‘wisdom spots,’ ‘age spots,’ or ‘barnacles of life’
- well-demarcated waxy papule/plaque with classic “stuck on” appearance
- rarely pruritic
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

Pathophysiology
- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

Epidemiology
- unusual <30 yr old
- M>F
- autosomal dominant inheritance
- Leser-Trelat sudden appearance of SK that can be associated with malignancy, commonly gastric adenocarcinomas

Skin Phototypes (Fitzpatrick)

<table>
<thead>
<tr>
<th>Phototype</th>
<th>Colour of Skin</th>
<th>Skin’s Response to Sun Exposure (without SPF protection)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>

</tr>
<tr>
<td>V</td>
<td>Brown</td>
<td>Rarely burns, dark tan</td>
</tr>
<tr>
<td>VI</td>
<td>Dark brown or black</td>
<td>Never burns, dark tan</td>
</tr>
</tbody>
</table>
Differential Diagnosis
- malignant melanoma (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

Investigations
- biopsy only if diagnosis uncertain

Management
- none required, for cosmetic purposes only
- cryotherapy, electrodesiccation, excision

ACTINIC KERATOSIS (SOLAR KERATOSIS)
- see Pre-Malignant Skin Conditions, D33

KERATOACANTHOMA
- see Malignant Skin Tumours, D34

CORNS (HELOMATA)

Clinical Presentation
- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

Pathophysiology
- localized hyperkeratosis induced by pressure on hands and feet

Epidemiology
- F>M, can be caused by chronic microtrauma

Differential Diagnosis
- calluses, plantar warts

Management
- relieve pressure with padding or alternate footwear, orthotics
- paring, topical salicylic acid

Keloids

Clinical Presentation
- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for years with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area, angle of mandible

Pathophysiology
- excessive deposition of randomly organized collagen fibres following trauma to skin

Epidemiology
- most common in black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

Management
- intralesional corticosteroid injections
- silicone compression
Pigmented Lesions

CONGENITAL NEVOMELANOCYTIC NEVI (CNMN)

Clinical Presentation
- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
  - classified by size: small (<1.5 cm), medium M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2 >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
  - may be surrounded by smaller satellite nevi

Pathophysiology
- nevomelanocytes in epidermis (clusters) and dermis (strands)

Epidemiology
- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNMN (melanocytes in the central nervous system)

Management
- take a baseline photo and observe lesion for change in shape, colour, or size out of proportion of growth
- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

OTHER CONGENITAL PIGMENTED LESIONS

Table 4. Comparison of Other Congenital Pigmented Lesions

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Differential Diagnosis</th>
<th>Clinical Course and Management</th>

</thead>
</table>
| Café-au-lait Macule   | Flat light brown lesions with smooth or jagged borders | Areas of increased melanogenesis | 6 or more is suggestive of neurofibromatosis type I Also associated with McCune Albright syndrome | Flat congenital nevomelanocytic nevus, speckled lentiginous nevus
|                       |                 |              |                        | Enlarge in proportion to the child No effective treatment |
| Speckled Lentiginous Nevus (nevus spilus) | Brown pigmented macular background (café-au-lait macule-like) with dark macular or papular speckles | Increased melanocyte concentration | Risk of melanoma similar to that of a CNMN of the same size | Café-au-lait macule, agminated lentigines, Becker’s nevus Usually the light macular background is present at birth and speckles develop over time. Management is similar to that of CNMNs |
| Dermal Melanocytosis (historically known as Mongolian Spot) | Congenital grey-blue solitary or grouped macules commonly on lumbosacral area | Ectopic melanocytes in dermis | 99% occurs in Asian and Indigenous infants | Ecchymosis Usually fades in early childhood but may persist into adulthood |

ACQUIRED NEVOMELANOCYTIC NEVI

Clinical Presentation
- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- 3 stages of evolution: junctional NMN, compound NMN, and dermal NMN

Table 5. Evolution of Acquired Nevomelanocytic Nevi

<table>
<thead>
<tr>
<th>Type</th>
<th>Age of Onset</th>
<th>Clinical Presentation</th>
<th>Histology</th>
</tr>
</thead>

</tbody>
</table>

DDx of Hyperpigmented Macules
- Purpura (e.g. solar, ASA, anti-coagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

Other Nevi
- Halo nevus: often a typical appearing nevus surrounded by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- Blue nevus: round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted
Management
- new or changing pigmented lesions should be evaluated for typical features which could indicate a melanoma
- excisional biopsy should be considered if the lesion demonstrates asymmetry, varied colours, irregular borders, pruritus or persistent bleeding

OTHER ACQUIRED PIGMENTED LESIONS

HEMANGIOMAS

Clinical Presentation
- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a “bag of worms” when palpated

Pathophysiology
- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion
Table 8. Vascular Tumours

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>

</thead>
<tbody>
<tr>
<td>Hemangioma of Infancy</td>
<td>Hot, firm red to blue plaques or tumours</td>
<td>Benign vascular proliferation of endothelial lining</td>
<td>Appears shortly after birth; rarely may be congenital</td>
<td>Appears shortly after birth, increases in size over months, then regresses. 50% of lesions resolve spontaneously by 5 yr. 10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis. Consider treatment if not gone by school age; topical timolol, propranolol; systemic corticosteroids; laser treatment; surgery.</td>
</tr>
<tr>
<td>Spider Angioma (Campbell Telangiectasia)</td>
<td>Central red arteriole with slender branches, blanchable</td>
<td>Can be associated with hyperestrogenic state (e.g. in hepatocellular disease, pregnancy, OCP) but often is not</td>
<td>Any age</td>
<td>Increase in number over time. Reassurance. Electrodesiccation or laser surgery if patient wishes.</td>
</tr>
<tr>
<td>Cherry Angioma (Campbell De Morgan Spot)</td>
<td>Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm</td>
<td>Benign vascular neoplasm</td>
<td>&gt;30 yr old</td>
<td>Lesions do not fade in time. Lesions bleed infrequently. Usually no treatment needed. Laser or electocautery for small lesions. Excision of large lesions if necessary.</td>
</tr>
<tr>
<td>Pyogenic Granuloma</td>
<td>Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes</td>
<td>Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia</td>
<td>&lt;30 yr old</td>
<td>Lesion grows rapidly over weeks to months, then stabilizes. Lesion may persist indefinitely if untreated. Surgical excision with histologic examination. Electrocautery; laser; cryotherapy.</td>
</tr>
</tbody>
</table>

VASCULAR MALFORMATIONS

</thead>
<tbody>
<tr>
<td>Nevus Flammeus (Port-wine stain)</td>
<td>Red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline. Most common site: nape of neck. Never spontaneously regress but grows in proportion to the child.</td>
<td>Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution).</td>
<td>Laser or make-up.</td>
</tr>
<tr>
<td>Nevus Simplex (salmon patch)</td>
<td>Pink-red irregular patches Midline macule on glabella known as “Angel Kiss”; on nuchal region known as “Stork Bites”. Present in 1/3 of newborns. Majority regress spontaneously.</td>
<td>Congenital dilation of dermal capillaries.</td>
<td>No treatment required.</td>
</tr>
</tbody>
</table>

Lipoma

Clinical Presentation
- single or multiple non-tender subcutaneous tumours that are soft and mobile
- occurs most frequently on the trunk, and extremities but can be anywhere on the body

Pathophysiology
- adipocytes enclosed in a fibrous capsule

Epidemiology
- often solitary or few in number, if multiple can be associated with rare syndromes

Differential Diagnosis
- angiolipoma, liposarcoma

Investigations
- biopsy only if atypical features (painful, rapid growth, firm)

Management
- reassurance
- excision or liposuction only if desired for cosmetic purposes
Acneiform Eruptions

Acne Vulgaris/Common Acne

Clinical Presentation
A common inflammatory pilosebaceous disease categorized with respect to severity
- Type I: comedonal, sparse, no scarring
- Type II: comedonal, papular, moderate ± little scarring
- Type III: comedonal, papular, and pustular, with scarring
- Type IV: nodulocystic acne, risk of severe scarring
- Sites of predilection: face, neck, upper chest, and back

Pathophysiology
- Hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
- Androgens promote excess sebum production
- Propionibacterium acnes metabolize sebum to free fatty acids and produces pro-inflammatory mediators

Epidemiology
- Age of onset in puberty (10-17 yr in females, 14-19 yr in males)
- In prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- Incidence decreases in adulthood
- Genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

Differential Diagnosis
- Folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

Table 10. Management of Acne

</tr>
<tr>
<td>Isotretinoin</td>
<td>Accutane®, Clarus®, Epinus®</td>
<td>See Table 27 for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and β-hCG before treatment May transiently exacerbate acne before patient sees improvement Refractory cases may require multiple courses of isotretinoin</td>
</tr>
</tbody>
</table>

Acne Exacerbating Factors
- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danaol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

Acne Myths Debunked
- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

Intralesional injections
Intralesional corticosteroids injections are effective in the treatment of individual acne nodules

Isotretinoin and Pregnancy
- Use of Isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Patients should use 2 forms of contraception while on isotretinoin

Treatment of Acne Scars
- Tretinoin creams
- Vincoc acid
- Chemical peels for superficial scars
- Injectable fillers (collagen, hyaluronic acid) for pitted scars
- Fraxel laser
- CO₂ laser resurfacing
Perioral Dermatitis

**Clinical Presentation**
- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal, and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

**Epidemiology**
- 15-40 yr old, occasionally in younger children
- predominantly females

**Differential Diagnosis**
- contact dermatitis, rosacea, acne vulgaris

**Management**
- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)
- occasional use of a non-steroidal anti-inflammatory cream (i.e. tacrolimus or pimecrolimus)

Rosacea

**Clinical Presentation**
- dome-shaped inflammatory papules ± pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, caffeine, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharoconjunctivitis, keratitis, iritis

**Pathophysiology**
- unknown

**Epidemiology**
- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

**Differential Diagnosis**
- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

**Management**
- trigger avoidance and daily sunscreen use for long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; parring, electrosurgery, cryotherapy, laser therapy (CO₂, argon, Nd:YAG)

**Guidelines for the Diagnosis of Rosacea**

- Presence of one or more of the following primary features:
  - Flushing (transient erythema)
  - Nontransient erythema
  - Papules and pustules
  - Telangiectasia
- May include one or more of the following secondary features:
  - Burning or stinging
  - Dry appearance
  - Edema
  - Phymatous changes
  - Ocular manifestations
  - Peripheral location

**Table 11. Specific Rosacea Treatments**

Dermatitis (Eczema)

**Definition**
- inflammation of the skin

**Clinical Presentation**
- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting, excoriations
- chronic dermatitis: lichenification, xerosis, fissuring

**Asteatotic Dermatitis**

**Clinical Presentation**
- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. "winter itch") but starts in the fall
- shins predominate, looks like a "dried river bed"

**Management**
- skin rehydration with moisturizing routine ± corticosteroid creams

**Atopic Dermatitis**

**Clinical Presentation**
- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, "chicken skin"), xerosis, occupational hand dryness

**Epidemiology**
- frequently affects infants, children, and young adults
- 10-20% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever), anaphylaxis, eosinophilia
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

**Pathophysiology**
- a T-cell driven inflammatory process with epidermal barrier dysfunction

**Investigations**
- clinical diagnosis
- consider: skin biopsy, patch testing if allergic contact dermatitis is suspected

**Management**
- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early
- avoid triggers of AD
- non-pharmacologic therapy
  - moisturizers
    - apply liberally and reapply at least twice a day with goal of minimizing xerosis
    - include in treatment of mild to severe disease as well as in maintenance therapy
  - bathing practices
    - bathe in plain warm water for a short period of time once daily followed by lightly but not completely drying the skin with a towel; immediately apply topical agents or moisturizers after this
  - use fragrance-free hypoallergenic non-soap cleansers
- pharmacologic therapy
  - topical corticosteroids
    - effective in reducing acute and chronic symptoms as well as prevention of flares
    - choice of steroid potency depends on age, body site, short vs. long-term use
    - apply 1 adult fingertip unit (0.5 g) to an area the size of 2 adult palms bid for acute flares
    - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneiform eruption are all very rarely seen

**Triggers for Atopic Dermatitis**
- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. S. aureus)
- Stress

Figure 4. Atopic dermatitis distribution
The typical distribution of atopic dermatitis in infants <6 mo (top), children >18 mo (middle) and adults (bottom)
- topical calcineurin inhibitors
  - tacrolimus 0.03%, 0.1% (Protopic®) and pimecrolimus 1% (Elidel®)
  - use as steroid-sparing agents in the long-term
  - advantages over long-term corticosteroid use: sustained effect in controlling pruritus; no skin atrophy; safe for the face and neck
  - apply 2x/d for acute flares, and 2-3x/wk to recurrent sites to prevent relapses
  - local side effects: stinging, burning, allergic contact dermatitis
  - U.S. black box warning of malignancy risk: rare cases of skin cancer and lymphoma reported; no causal relationship established

Complications
- infections
  - treatment of infections
    - topical mupirocin or fusidic acid (Canada only, not available in US)
    - oral antibiotics (e.g. cloxacillin, cephalaxin) for widespread S. aureus infections

Contact Dermatitis
- cutaneous inflammation caused by an external agent(s)

Table 12. Contact Dermatitis

</tbody>
</table>
**Dyshidrotic Dermatitis**

**Clinical Presentation**
- "tapioca pudding" papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infections common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

**Pathophysiology**
- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate flares

**Management**
- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic
  - prednisone in severe cases
  - antibiotics for secondary S. aureus infection

**Nummular Dermatitis**

**Clinical Presentation**
- nummular (coin-shaped), pruritic, dry, scaly, erythematous plaques
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

**Pathophysiology**
- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

**Management**
- moisturization
- mid to high potency corticosteroid ointment bid

**Seborrheic Dermatitis**

**Clinical Presentation**
- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: "cradle cap"
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

**Pathophysiology**
- possible etiologic association with Malassezia spp. (yeast)

**Epidemiology**
- common in infants and adolescents
- increased incidence and severity in immunocompromised patients
- in adults, can cause dandruff ( pityriasis sicca)

**Management**
- face: ketoconazole (Nizoral®) cream daily or bid + mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoother FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Stiepro®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)
Stasis Dermatitis

Clinical Presentation
- erythematous, scaly, pruritic plaques in lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages
  usually bilateral, accompanied by swelling, oozing, crusting, may have accompanying varicosities

Pathophysiology
- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

Investigations
- Doppler and colour-coded Duplex sonography if suspicious for DVT
- swab for bacterial culture if there is crusting

Management
- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

Complications
- ulceration (common at medial malleolus), secondary bacterial infections

Lichen Simplex Chronicus

Clinical Presentation
- well-defined plaque(s) of lichenified skin with increased skin markings ± excoriations
- common sites: neck, scalp, lower extremities, urogenital area
- often seen in patients with atopy

Pathophysiology
- skin hyperexcitable to itch, continued rubbing/scratching of skin results
- eventually lichenification occurs

Investigations
- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, bilirubin, renal and thyroid function tests, TSH, glucose, SPEP
- CXR if lymphoma suspected

Management
- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)

Papulosquamous Diseases

Lichen Planus

Clinical Presentation
- acute or chronic inflammation of mucous membranes or skin, especially on flexural surfaces
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules
- common sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis
- spontaneously resolves but may last for weeks, months or years (mouth and skin lesions)
- rarely associated with hepatitis C
- Köbner phenomenon

Pathophysiology
- autoimmune, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

Epidemiology
- 1%
- 30-60 yr old, F>M
Investigations
- consider a skin biopsy
- hepatitis C serology if patient has risk factors

Management
- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy or oral retinoids or systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine) for extensive or recalcitrant cases

Pityriasis Rosea

Clinical Presentation
- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer's Lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a “herald” patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

Etiology
- suspected HHV-7 or HHV-6 reactivation

Investigations
- none required

Management
- none required; clears spontaneously in 6-12 wk
- symptomatic: topical glucocorticoids if pruritic, cool compresses, emollients

Psoriasis

Classification
1. plaque psoriasis
2. guttate psoriasis
3. erythrodermic psoriasis
4. pustular psoriasis
5. inverse psoriasis

Pathophysiology
- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle leads to Th1 and Th17-mediated inflammatory response

Epidemiology
- 1.5-2%, M=F
- all ages: peaks of onset: 20-30 and 50-60
- polygenic inheritance: 8% with 1 affected parent, 41% with both parents affected
- risk factors: smoking, obesity, alcohol, drugs, infections

Differential Diagnosis
- AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

Investigations
- biopsy (if atypical presentation, rarely needed)

1. PLAQUE PSORIASIS

Clinical Presentation
- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun and humidity)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

Topical Treatments for Chronic Plaque Psoriasis
Cochrane Database Syst Rev 2013;(1):CD005028
Purpose: To compare the effectiveness, tolerability and safety of topical treatments for chronic plaque psoriasis, and to compare vitamin D analogues with other topical treatments.
Methods: Systematic review of RCTs comparing active topical treatments against placebo or against vitamin D analogues (used alone or in combination) in people with chronic plaque psoriasis. Primary outcome was investigator assessed of overall global improvement, total severity scores, psoriasis area and severity index, and patient assessment of overall global improvement.
Results: 48 trials were included in total, with 26 trials focused on scalp psoriasis and 2 trials on sites of psoriasis, facial psoriasis or both. Most vitamin D analogues were significantly more effective than placebo for topical use on the body. Most corticosteroids were significantly more effective than placebo, with potent corticosteroids having similar benefits to very potent corticosteroids. Topical treatments with vitamin D analogues and corticosteroids performed at least as well as vitamin D analogues, and they are associated with a lower incidence of local adverse events. Combined treatment with vitamin D and corticosteroids, and tacrolimus performed significantly better than placebo. Combined treatment with vitamin D and corticosteroids performed significantly better than vitamin D alone or corticosteroids alone for body and scalp psoriasis. Vitamin D generally performed better than placebo, but findings compared to dithranol were mixed. Vitamin D was significantly less effective than both potent and very potent corticosteroids for scalp psoriasis. Potent corticosteroids were less likely than vitamin D to cause local adverse events (i.e., burning, irritation). Combined treatment with vitamin D and corticosteroids was tolerant as well as potent corticosteroids, and significantly better than vitamin D alone for body and scalp use.
Conclusion: Corticosteroids perform at least equally if not superior to vitamin D analogues and are associated with fewer local adverse events. The risk of skin dermal atrophy with long-term use of corticosteroids for people with chronic plaque psoriasis remains unclear.
Management
- Principles of management depend on severity of disease, as defined by BSA affected or less commonly Psoriasis Area and Severity Index (PASI)
- Mild (<3% BSA)
  - Topical steroids, topical vitamin D3 analogues, or a combination of the two are first line
  - Topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to be less tolerated than first line therapies
  - Emollients
  - Phototherapy or systemic treatment may be necessary if the lesions are scattered or if it involves sites that are difficult to treat such as palms, soles, scalp, genitals
- Moderate (3-10% BSA) to severe (>10% BSA)
  - Goal of treatment is to attain symptom control that is adequate from patient’s perspective
  - Phototherapy if accessible
  - Systemic or biological therapy based on patient’s treatment history and comorbidities
  - Topical steroid ± topical vitamin D3 analogue as adjunct therapy

*Can also be used to treat psoriatic arthritis

- Biologics under study for treatment of psoriasis: brodalumab, risankizumab, tildrakizumab, guselkumab
2. GUTTATE PSORIASIS (“DROP-LIKE”)

Clinical Presentation
- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

Management
- UVB phototherapy, sunlight, lubricants, topical steroids
- penicillin V or erythromycin if Group A β hemolytic Streptococcus on throat culture

3. ERYTHRODERMIC PSORIASIS

Clinical Presentation
- generalized erythema (> 90% of body surface area) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium, β-blockers, NSAIDs, antimalarials, phototoxic reaction, infection

Management
- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition, sun avoidance
- cyclosporine, acitretin, methotrexate, UV, biologics

4. PUSTULAR PSORIASIS

Clinical Presentation
- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy

Management
- methotrexate, cyclosporine, acitretin, UV, biologics

5. INVERSE PSORIASIS

Clinical Presentation
- erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

Management
- low potency topical corticosteroids
- topical vitamin D derivatives such as calcipotriene or calcitriol
- topical calcineurin inhibitors such as tacrolimus or pimecrolimus

6. PSORIATIC ARTHRITIS

- 20-30% of patients with psoriasis can also be suffering from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see Rheumatology, RH23

Vesiculobullous Diseases

Bullous Pemphigoid

Clinical Presentation
- chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- can present as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

Pathophysiology
- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

Epidemiology
- mean age of onset: 60-80 yr old, F=M
**Investigations**
- Immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- Anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

**Prognosis**
- Heals without scarring, usually chronic
- Rarely fatal

**Management**
- Prednisone 0.5-1 mg/kg/day until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclosporine, mycophenolate mofetil)
- Topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
- Tetracycline ± nicotinamide is effective for some cases
- Immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
- IVlg and plasmapheresis for refractory cases

---

**Pemphigus Vulgaris**

**Clinical Presentation**
- Autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
- May present with erosions and secondary bacterial infection
- Sites: mouth (90%), scalp, face, chest, axilla, groin, umbilicus
- Nikolsky's sign: epidermal detachment with shear stress
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

**Pathophysiology**
- IgG against epidermal desmoglein-1 and -3 lead to loss of intercellular adhesion in the epidermis

**Epidemiology**
- 40-60 yr old, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
- Paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

**Investigations**
- Immunofluorescence: shows IgG and C3 deposition intraepidermally
- Circulating serum anti-desmoglein IgG antibodies

**Prognosis**
- Lesions heal with hyperpigmentation but do not scar
- May be fatal unless treated with immunosuppressive agents

**Management**
- Prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclophosphamide, cyclosporine, IVlg, mycophenolate mofetil, rituximab)

---

**Dermatitis Herpetiformis**

**Clinical Presentation**
- Grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
- Lesions grouped, bilaterally symmetrical
- Common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

**Pathophysiology**
- Transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
- 90% have HLA B8, DR3, DQWZ
- 90-100% associated with an often subclinical gluten-sensitive enteropathy (i.e. celiac disease)
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

**Epidemiology**
- 20-60 yr old, M:F = 2:1

**Investigations**
- Biopsy
- Immunofluorescence shows IgA deposits in perilesional skin

**Management**
- Dapsone (sulfapyridine if contraindicated or poorly tolerated)
- Gluten free diet for life – this can reduce risk of lymphoma
Porphyria Cutanea Tarda

**Clinical Presentation**
- skin fragility followed by formation of tense vesicles/bullae and erosions on photoexposed skin
- gradual healing to scars, milia
- periorbital violaceous discoloration, diffuse hypermelanosis, facial hypertrichosis
- common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

**Pathophysiology**
- uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
- can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

**Epidemiology**
- 30-40 yr old, M>F

**Investigations**
- urine + 5% HCl shows orange-red fluorescence under Woods lamp (UV rays)
- 24 h urine for uroporphyrins (elevated)
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

**Management**
- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

Drug Eruptions

**Exanthematous**

**EXANTHEMATIC DRUG REACTION**

**Clinical Presentation**
- morphology: erythematous macules and papules ± scale
- spread: symmetrical, trunk to extremities
- time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

**Epidemiology**
- most common cutaneous drug reaction; increased in presence of infections
- common causative agents: penicillin, sulfonamides, phenytoin

**Management**
- weigh risks and benefits of drug discontinuation
- antihistamines, emollients, topical steroids

**DRUG INDUCED HYPERSENSITIVITY SYNDROME (DIHS) / DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)**

**Clinical Presentation**
- morphology: morbilliform rash involving face, trunk, arms; can have facial edema
- systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonia, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- spread: starts with face or periorbitally and spreads caudally; no mucosal involvement
- time course: onset 1-6 weeks after first exposure to drug; persists weeks after withdrawal of drug

**Epidemiology**
- rare: incidence varies considerably depending on drug
- common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
- 10% mortality if severe, undiagnosed, and untreated

**Management**
- discontinue offending drug ± prednisone 0.5mg/kg per day, consider cyclosporine in severe cases
- may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued
Urticarial

DRUG INDUCED URTICARIA AND ANGIOEDEMA

Clinical Presentation
- morphology: wheals lasting >24 h unlike non drug induced urticaria, angioedema (face and mucous membranes)
  - systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
  - time course: hours to days after exposure depending on the mechanism

Epidemiology
- second most common cutaneous drug reaction
- common causative agents: penicillins, ACEI, analgesics/anti-inflammatories radiographic contrast media

Management
- discontinue offending drug, treatment with antihistamines, steroids, epinephrine if anaphylactic

SERUM SICKNESS-LIKE REACTION

Clinical Presentation
- morphology: symmetrical cutaneous eruption (usually urticarial)
- systemic features: malaise, low grade fever, arthralgia, lymphadenopathy
- time course: appears 1-3 wk after drug initiation, resolve 2-3 wk after withdrawal

Epidemiology
- more prevalent in kids 0.02-0.2%
- common causative agents: cefaclor in kids; bupropion in adults

Management
- discontinue offending drug ± topical/oral corticosteroids

Pustular

ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

Clinical Presentation
- morphology: erythematous edema and sterile pustules prominent in intertriginous areas
- systemic features: high fever, leukocytosis with neutrophilia
- spread: starts in face and intertriginous areas and spread to trunk and extremities
- time course: appears 1 wk after drug initiation, resolve 2 wk after withdrawal

Epidemiology
- rare: 1-5/million
- common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

Management
- discontinue offending drug and systemic corticosteroids

Bullous

STEVEN JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

Clinical Presentation
- morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluence of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss; dusky tender skin, bullae, desquamation/skin sloughing, atypical targets
- classification: BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
- spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
- systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synechiae
- time course: appears 1-3 wk after drug initiation; progression <4 d; epidermal regrowth in 3 wk
- can have constitutional symptoms: malaise, fever, hypotension, tachycardia

Epidemiology
- SJS: 1.2-6/million; TEN: 0.4-1.2/million
- risk factors: SLE, HIV/AIDS, HLA-B1502 (associated with carbamazepine), HLA-B5801 (associated with allopurinol)
- common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections
- prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss and infection

SCORTEN Score for TEN Prognosis

One point for each of: age ≥40, malignancy, body surface area detached ≥10%, tachycardia >120 bpm, serum urea >10 mmol/L, serum glucose >14 mmol/L serum bicarbonate <20 mmol/L

Used to determine appropriate clinical setting: score 0-1 can be treated in non-specialized wards; score ≥2 should be transferred to intensive care or burn unit

Score at admission is predictive of survival: 94% for 0-1, 87% for 2, 53% for 3, 25% for 4, and 17% for ≥5
**Differential Diagnosis**
- scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

**Management**
- discontinue offending drug
- admit to intermediate/intensive care/burn unit
- supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
- IV Ig or cyclosporine or etanercept

**FIXED DRUG ERUPTION**

**Clinical Presentation**
- morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
- spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

**Epidemiology**
- common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

**Management**
- discontinue offending drug ± prednisone 1mg/kg/d x 2 wk for generalized lesions ± potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

**PHOTOSENSITIVITY REACTION**

**Clinical Presentation**
- phototoxic reaction: “exaggerated sunburn” (erythema, edema, vesicles, bullae) confined to sun-exposed areas
- photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

**Pathophysiology**
- phototoxic reaction: direct tissue injury
- photoallergic reaction: type IV delayed hypersensitivity

**Epidemiology**
- common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

**Management**
- sun protection ± topical/oral corticosteroids

**Heritable Disorders**

**Ichthyosis Vulgaris**

**Clinical Presentation**
- xerosis with fine scaling as well as large adherent scales (“fish-scales”)
- affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
- improves in summer, with humidity, and as the child grows into adulthood

**Pathophysiology**
- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

**Epidemiology**
- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

**Investigations**
- electron microscopy keratohyalin granules

**Management**
- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or α or β-hydroxy acids
- intermittent systemic retinoids for severe cases
Neurofibromatosis (Type I; von Recklinghausen’s Disease)

Clinical Presentation
- diagnostic criteria includes 2 or more of the following
  1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child <5 yr
  2. axillary or inguinal freckling
  3. iris hamartomas (Lisch nodules)
  4. optic gliomas
  5. neurofibromas
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. first degree relative with neurofibromatosis type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see Pediatrics, P79)

Pathophysiology
- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

Epidemiology
- incidence 1:3,000

Investigations
- Wood’s lamp examination to detect café-au-lait macules in patients with pale skin

Management
- refer to orthopedics, ophthalmology, plastics, and psychology for relevant management
- follow-up annually for brain tumours such as astrocytoma
- excise suspicious or painful lesions
- see Pediatrics, P79

Vitiligo

Clinical Presentation
- primary pigmented disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply margined white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

Pathophysiology
- acquired autoimmune destruction of melanocytes

Epidemiology
- 1% incidence, polygenic
- 30% with positive family history

Investigations
- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison’s disease, Type I DM
- Wood’s lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discolouration)

Management
- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or Narrow band UVB
- make-up
- “bleaching” normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

Interventions for Vitiligo
Cochrane Database Syst Rev. 2015;2:CD003263
Purpose: To assess the effects of existing interventions used in the management of vitiligo.
Study: Systematic review of RCTs assessing the effects of vitiligo treatments (topical treatments, light therapies, oral treatments, surgical methods).
Primary outcomes were quality of life and >75% repigmentation adverse effects.
Results: Ninety-six RCTs with 4,512 participants were deemed eligible, of which only 25 reported on the primary outcomes and were finally included. Repigmentation was better with combination therapy (calcipotriol plus pсорalen with UVA light (PUVA) than PUVA alone, hydrocortisone-17-butyrate plus excimer laser vs. excimer laser alone; oral minipulse of prednisolone (OMP) plus narrowband UVB (NB-UVB) vs. OMP alone; aclarromine with PUVA vs. PUVA alone; 8-methoxypsoralen (8-MOP) plus sunlight versus psoralen). A non-significant increase in proportion of participants with >75% re-pigmentation was noted in favour of NB-UVB compared to PUVA. Compared to PUVA, the NB-UVB group reported lower incidences of nausea and erythema, but not itching.
Conclusions: Some studies support existing therapies for vitiligo management, but follow-up is needed to assess permanence of re-pigmentation and higher quality RCTs need to be conducted.
**Bacterial Infections**

**EPIDERMIS**

**IMPETIGO**

**Clinical Presentation**
- acute purulent infection which appears vesicular; progresses to golden yellow “honey-crusted” lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

**Etiology**
- GAS, *S. aureus*, or both

**Epidemiology**
- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

**Differential Diagnosis**
- infected eczema, HSV, VZV

**Investigations**
- Gram stain and culture of lesion fluid or biopsy

**Management**
- remove crusts, use saline compresses, and topical antiseptic soaks bid
- topical antibacterials such as 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution
- systemic antibiotics such as cloxacillin or cephalaxin for 7-10 d

---

**Location Matters!**

- **Impetigo** → just below stratum corneum
- **Erysipelas** → epidermis and upper dermis only
- **Cellulitis** → primarily lower dermis and subcutis (primarily not raised, and demarcation less distinct than erysipelas)
- **Necrotizing fasciitis** → deep fascia and muscle

---

**Figure 7. Layers of skin affected by bacterial infections**

**Dermatophytoses**

**Clinical Presentation**
- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

**Pathophysiology**
- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

**Etiology**
*Trichophyton, Microsporum, Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

**Investigations**
- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

**Management**
- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, or terbinafine or ciclopirox olamine cream applied bid
- oral therapy is indicated for onychomycosis or tinea capitis: terbinafine (Lamisil® – liver toxicity, CYP2D6 inhibitor) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity)

</table>

Parasitic Infections

SCABIES

Clinical Presentation
- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)

Pathophysiology
- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

Etiology
- Sarcoptes scabiei (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

Differential Diagnosis
- atopic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)
Infections

**Investigations**
- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

**Management**
- bath, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid potency topical steroids and antihistamines for symptom management

**LICE (PEDICULOSIS)**

**Clinical Presentation**
- intensely pruritic red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line and buttocks

**Etiology**
- *Phthirus pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds
- can transmit infectious agents such as *Bartonella quintana* and *Rickettsia prowazekii*

**Differential Diagnosis**
- bacterial infection of scalp, seborrheic dermatitis

**Diagnosis**
- lice visible on inspection of affected area or clothing seams

**Management**
- permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwella-P® shampoo)
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry

**BED BUGS (HEMIPTERA)**

**Clinical Presentation**
- burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch and dinner” – in areas with easy access (face, neck, arms, legs, hands)

**Etiology**
- caused by *Cimex lectularius*, a small insect that feeds mainly at night (hide in crevices in walls and furniture during the day)

**Differential Diagnosis**
- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

**Investigations**
- none required, but lesional biopsy can confirm insect bite reaction

**Management**
- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture
Viral Infections

HERPES SIMPLEX

Clinical Presentation
- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- primary
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- secondary
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- complications: dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi’s varicelliform eruption (eczema herpeticum)
- two biologically and immunologically different subtypes: HSV-1 and HSV-2
  - HSV-1
    - typically "cold sores" (grouped vesicles at the mucocutaneous junction which quickly burst)
    - recurrent on face, lips and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)
  - HSV-2
    - usually sexually transmitted; incubation 2-20 d
    - gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
    - vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
    - urethritis: watery discharge in males
    - recurrent on vulva, vagina, penis for 5-7 d
    - differential diagnosis of genital ulcers: Candida balanitis, chancroid, syphilitic chancres

Investigations
- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

Management
- HSV-1
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax®/Xerese®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- HSV-2
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burrow’s compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x/d x 10 d
  - maintenance: acyclovir 400 mg PO bid
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other sexually-transmitted infections STIs
  - for active lesions in pregnancy, see Obstetrics, OB29

HERPES ZOSTER (SHINGLES)

Clinical Presentation
- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson’s sign: shingles on the tip of the nose signifies ocular involvement. Shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve (V1)
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

Etiology
- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy
Differential Diagnosis
- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

Investigations
- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

Management
- compress with normal saline, Burow’s, or betadine solution
- analgesics (NSAIDs, amitriptyline)
- famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
- gabapentin 300-600 mg PO tid for post-herpetic neuralgia

MOLLUSCUM CONTAGIOSUM

Clinical Presentation
- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

Etiology
- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)
- virus is self-limited and can take 1-2 yr to resolve

Investigations
- none required, however can biopsy to confirm diagnosis

Management
- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- topical retinoids
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

WARTS (VERRUCA VULGARIS) (HUMAN PAPILLOMAVIRUS INFECTIONS)

Table 19. Different Manifestations of HPV Infection

<table>
<thead>
<tr>
<th>Verruca Vulgaris (Common Warts)</th>
<th>Definition and Clinical Features</th>
<th>Differential Diagnosis</th>
<th>Distribution</th>
<th>HPV Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV</td>
<td>Molluscum contagiosum, seborrheic keratosis</td>
<td>Located at trauma sites: fingers, hands, knees of children and teens</td>
<td>At least 80 types are known</td>
<td></td>
</tr>
</tbody>
</table>

| Verruca Planaris (Plantar Warts) and Verruca Palmaris (Palmar Warts) | Hyperkeratotic, shiny, sharply margined growths Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges | May need to scrape (“pare”) lesions to differentiate wart from callus and corn | Located at pressure sites: metatarsal heads, heels, toes | Commonly HPV 1, 2, 4, 10 |

| Verruca Planae (Flat Warts) | Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children | Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus | Sites: face, dorsa of hands, shins, knees | Commonly HPV 3, 10 |

| Condyloma Acuminata (Genital Warts) | Skin-coloured pinhead papules to soft cauliflower like masses in clusters Often occurs in young adults, infants, children Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Keboen phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhitrning (subclinical lesions seen with 5% acetic acid x 5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts) | Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum | Sites: genitalia and perianal areas | Commonly HPV 6 and 11 HPV 16, 18, 31, 33 cause cervical dysplasia, SCC and invasive cancer |
Treatment for Warts
- **first line therapies**
  - salicylic acid preparations (patches, solutions, creams ointments), cryotherapy, topical cantharone
- **second line therapies**
  - topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
- **third line therapies**
  - curettage, cautery, surgery for non plantar warts, CO2 laser, oral cimetidine (particularly children), intraslesional bleomycin (plantar warts), trichloroacetic acid, diphencyprone
  - other viruses associated with skin changes, such as measles, roseola, fifth disease, etc.
  - see Pediatrics, Pediatric Exanthems, P50

**Yeast Infections**

**CANDIDIASIS**

**Etiology**
- many species of Candida (70-80% of infections are from Candida albicans)
- opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

**Candidal Paronychia**
- clinical presentation: painful red swellings of periungual skin
- management: topical agents not as effective; oral antifungals recommended

**Candidal Intertrigo**
- clinical presentation
  - macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
  - peripheral “satellite” pustules
  - starts as non-infectious maceration from heat, moisture, and friction
- predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
- management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream bid until rash clears

**PITYRIASIS (TINEA) VERSICOLOR**

**Clinical Presentation**
- asymptomatic superficial fungal infection with brown/white scaling macules
- affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- common sites: upper chest and back

**Pathophysiology**
- microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; require fatty acids to survive

**Etiology**
- Pityrosporum ovale (Malassezia furfur)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, excessive sweating, Cushing's syndrome, prolonged corticosteroid use

**Investigations**
- clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

**Management**
- ketoconazole shampoo or cream daily
- topical terbinafine or ciclopirox olamine bid
- systemic fluconazole or itraconazole for 7 d if extensive

**Sexually Transmitted Infections**

**SYPHILIS**

**Clinical Presentation**
- characterized initially by a painless ulcer (chancre)
- following inoculation, systemic infection with secondary and tertiary stages

**Etiology**
- Treponema pallidum
- transmitted sexually, congenitally, or rarely by transfusion
Table 20. Stages of Syphilis

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Investigations</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Syphilis</strong></td>
<td>CANNOT be based on clinical presentation alone</td>
<td>Penicillin G, 2.4 million units IM, single dose</td>
</tr>
<tr>
<td>Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate</td>
<td>VDRL negative – repeat weekly for 1 mo</td>
<td></td>
</tr>
<tr>
<td>Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-8 wk; chancre may also develop on lips or anus</td>
<td>Fluorescent treponemal antibody-syphilis (FTA-ABS) test has greater sensitivity and may detect disease earlier in course</td>
<td></td>
</tr>
<tr>
<td>Regional non-tender lymphadenopathy appears &lt; 1 wk after onset of chancre</td>
<td>Dark field examination – spirochete in chancre fluid or lymph node aspirate</td>
<td></td>
</tr>
<tr>
<td>DDx: chancroid (painful), HSV (multiple lesions)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Secondary Syphilis**

Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre)

Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia

Lesions heal in 1-5 wk and may recur for 1 yr

3 types of lesions:
1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus)
2. Condyloma lata: wart-like moist papules around genital/perianal region
3. Mucous patches: macerated patches mainly found in oral mucosa

VDRL positive

FTA-ABS +ve; –ve after 1 yr following appearance of chancre

Dark field +ve in all secondary

As for primary syphilis

**Tertiary Syphilis**

Extremely rare

3-7 yr after secondary

Main skin lesion: ‘Gumma’ – a granulomatous nontender nodule

As in primary syphilis, VDRL can be falsely negative

Treatment: penicillin G, 2.4 million units IM weekly x 3 wk

GONOCOCCEMIA

**Clinical Presentation**
- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

**Etiology**
- *Neisseria gonorrhoeae*

**Investigations**
- requires high index of clinical suspicion plays because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

**Management**
- notify Public Health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 1 g IM

HSV
- see Viral Infections, D29

HPV
- see Viral Infections, D30
Pre-Malignant Skin Conditions

Actinic Keratosis (Solar Keratosis)

Clinical Presentation
- ill-defined, scaly, erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

Pathophysiology
- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1,000), but higher likelihood if AK is persistent
- UV-induced p53 gene mutation
- risk factors: increased age, light skin/eyes/hair, immunosuppression, syndromes such as albinism or xeroderma pigmentosum
- risk factors for malignancy: immunosuppression, history of skin cancer, persistence of the AK

Epidemiology
- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in darker skin as melanin is protective

Differential Diagnosis
- SCC in situ, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

Investigations
- biopsy lesions that are refractory to treatment

Management
- destructive: cryotherapy, electrodesiccation, and curettage
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-Fluorouracil cream (for 2-4 wk), Imiquimod 5% (2 times per wk for 16 wk), Imiquimod 3.75% (daily for 2 wk then none for 2 wk then daily for 2 wk) Ingenol Mebutate gel 0.015% (daily for 3 d on the head and neck), Ingenol mebutate 0.05% gel (daily for 2 d on the body)
- photodynamic therapy
- excision

Types of AK
- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

Leukoplakia

Clinical Presentation
- a morphologic term describing homogenous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

Pathophysiology
- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption

Epidemiology
- 1-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

Differential Diagnosis
- lichen planus, oral hairy leukoplakia

Investigations
- biopsy is mandatory because it is premalignant

Management
- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, follow-up
- moderate/dysplastic lesions: excision, cryotherapy
Malignant Skin Tumours

Non-Melanoma Skin Cancers

BASAL CELL CARCINOMA

Subtypes
- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent ("pearly") telangiectatic border, and depressed/eroded/ulcerated centre
- pigmented variant
  - flecks of pigment in translucent lesion with surface telangiectasia
  - may mimic malignant melanoma
- superficial variant
  - flat, tan to red-brown plaque, often with scaly, pearly border and fine telangiectasia at margin
  - least aggressive subtype
- sclerosing (morpheaform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

Pathophysiology
- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on face
  - may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin syndrome)

Epidemiology
- most common malignancy in humans
- 75% of all malignant skin tumours >40 yr, increased prevalence in the elderly
- M>F , skin phototypes I and II, chronic cumulative sun exposure, ionizing radiation, immunosuppression, arsenic exposure

Differential Diagnosis
- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular malignant melanoma, SCC

Management
- imiquimod 5% cream (Aldara®) or cryotherapy is indicated for superficial BCCs on the trunk
- fluorouracil and photodynamic therapy can also be used for superficial BCC
- shave excision + electrodessication and curettage for most types of BCCs, not including morpheaform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct
- radiotherapy used in advanced cases of BCC where surgical intervention is not an option
- vismodegib is approved for metastatic BCC
- life-long follow-up every 6 mo-1 yr
  - 95% cure rate if lesion <2 cm in diameter or if treated early

SQUAMOUS CELL CARCINOMA

Clinical Presentation
- indurated, pink/red/skin-coloured papule/plaque/nodule with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- exophytic (grows outward), may present as a cutaneous horn
- sites: face, ears, scalp, forearms, dorsum of hands

Pathophysiology
- malignant neoplasm of keratinocytes (primarily vertical growth)
  - predisposing factors include: UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

Epidemiology
- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients SCC is most common cutaneous malignancy, with increased mortality as compared to non immunocompromised population

Differential Diagnosis
- benign: nummular eczema, psoriasis, irritated seborrheic keratosis
- malignant: keratoacanthoma, Bowen’s disease, BCC
Management
• surgical excision with primary closure, skin flaps or grafting
• Mohs surgery
• lifelong follow-up (more aggressive treatment than BCC)

Prognosis
• good prognostic factors: early treatment, negative margins, and small size of lesion
• SCCs that arise from AK metastasize less frequently (~1%) than other SCCs arising de novo in old
  burns (2-5% of cases)
• overall control is 75% over 5 yr, 5-10% metastasize
• metastasis rates are higher if diameter >2 cm, depth >4 mm, recurrent, involvement of bone/muscle/
  nerve, location on scalp/ears/nose/lips, immunosuppressed, caused by arsenic ingestion, or tumour
  arose from scar/chronic ulcer/burn/genital tract/sinus tract

BOWEN’S DISEASE (SQUAMOUS CELL CARCINOMA IN SITU)

Clinical Presentation
• sharply demarcated erythematous patch/thin plaque with scale and/or crusting
• often 1-3 cm in diameter and found on the skin and mucous membranes
• evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

Management
• same as for BCC
• biopsy required for diagnosis
• topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify
  margins of poorly defined tumours
• cryosurgery
• shave excision with electrodesiccation and curettage

KERATOACANTHOMA

Clinical Presentation
• rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled
  crater, resembling an erupting volcano
• may spontaneously regress within a year, leaving a scar
• sites: sun-exposed skin

Pathophysiology
• epithelial neoplasm with atypical keratinocytes in epidermis
• low grade variant of SCC

Etiology
• HPV, UV radiation, chemical carcinogens (tar, mineral oil)

Epidemiology
• >50 yr, rare <20 yr

Differential Diagnosis
• treat as SCC until proven otherwise
• hypertrophic solar keratosis, verruca vulgaris

Management
• surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated
  similarly to SCC

Malignant Melanoma

Clinical Presentation
• malignant characteristics of a mole: “ABCDE” mnemonic
• sites: skin, mucous membranes, eyes, CNS

Clinical Subtypes of Malignant Melanoma
• lentigo maligna
  • malignant melanoma in situ (normal and malignant melanocytes confined to the epidermis)
  • 2-6 cm, tan brown/black uniformly flat macule or patch with irregular borders
  • lesion grows radially and produces complex colours
  • often seen in the elderly
  • 10% evolve to lentigo maligna melanoma

Does this Patient have a Mole or Melanoma?

ABCD checklist
Asymmetry
Border (irregular and/or indistinct)
Colour (varied)
Diameter (increasing or >6 mm)
Enlargement, elevation, evolution (i.e. change in colour, size, or shape)

Sensitivity 92% (CI 82-98%)
Specificity 100% (CI 84-100%)

JAMA 1998;279:696-701
• **lentigo maligna melanoma** (15% of all melanomas)
  - malignant melanocytes invading into the dermis
  - associated with pre-existing solar lentigo, not pre-existing nevi
  - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  - with time, colour changes from uniform brown to dark brown with black and blue
  - found on all skin surfaces, especially those often exposed to sun, such as the face and hands

• **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discoloration, focal papules or nodules
  - ulcerate and bleed with growth

• **nodular melanoma** (30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - “EFG” elevated, firm, growing

• **acral lentiginous melanoma** (5% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungual skin
  - melanomas on mucous membranes have poor prognosis

**Pathophysiology**
- malignant neoplasm of pigment-forming cells (melanocytes and nevus cells)

**Epidemiology**
- incidence: 1/75 (Canada) 1/50 (US)
- risk factors: numerous moles, fair skin, red hair, personal/family history, 1 large congenital nevus (>20 cm), familial dysplastic nevus syndrome, any dysplastic nevi, immunosuppression, > 50 common nevi, and sun exposure with sunburns, tanning beds
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

**Differential Diagnosis**
- benign: nevi, solar lentigo, seborrheic keratosis
- malignant: pigmented BCC

**Management**
- excisional biopsy preferable, otherwise incisional biopsy
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic, gene therapies, and vaccines starting to be used in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

**Table 21. American Joint Committee on Cancer Staging System Based on Breslow’s Thickness of Invasion**

a = no ulceration; b = ulceration

**Other Cutaneous Cancers**

**CUTANEOUS T-CELL LYMPHOMA**

**Clinical Presentation**
- **Mycosis fungoides** (limited superficial type)
  - characterized by erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy telangiectasia, hyperpigmentation, hypopigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease

- **Sézary syndrome** (widespread systemic type)
  - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10^9/L with Sézary cells
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - often fatal
Pathophysiology
• clonal proliferation of skin-homing CD4 T-cells

Epidemiology
• >50 yr old, M:F 2:1

Differential Diagnosis
• tinea corporis, nummular dermatitis, psoriasis DLE, Bowen’s disease

Investigations
• skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
• blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
• imaging (for systemic involvement)

Management
• Mycosis fungoides
  • depends on stage of disease
  • topical steroids and/or PUVA, narrow band UVB (NBUVB, 311-313nm)
• Sézary syndrome
  • oral retinoids and IFN
  • extra-corporeal photopheresis
  • may need radiotherapy for total skin electron beam radiation
  • may maintain on UV therapy
  • other chemotherapy agents

Diseases of Hair Density

Hair Growth
• hair grows in a cyclic pattern that is defined in 3 stages (most scalp hairs are in anagen phase)
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
• total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
• growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

Non-Scarring (Non-Cicatricial) Alopecia

ANDROGENETIC ALOPECIA

Clinical Presentation
• male- or female-pattern alopecia
• males: fronto-temporal areas progressing to vertex, entire scalp may be bald
• females: widening of central part, "Christmas tree" pattern

Pathophysiology
• action of testosterone on hair follicles

Epidemiology
• males: early 20s-30s
• females: 40s-50s

Management
• minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
• males: spironolactone (anti-androgenic effects), cyproterone acetate (Diane-35°)
• males: finasteride (Propecia®) (5-a-reductase inhibitor) 1 mg/d
• hair transplant

PHYSICAL
• trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
• traumatic (e.g. tight "corn-row" braiding of hair, wearing tight pony tails, tight tying of turbans)

DDx of Non-Scarring (Non-Cicatricial) Alopecia
• Autoimmune
  • Alopecia areata
• Endocrine
  • Hypothyroidism
  • Androgens
• Micronutrient deficiencies
  • Iron
  • Zinc
• Toxins
  • Heavy metals
  • Anticoagulants
  • Chemotherapy
  • Vitamin A
• Trauma to the hair follicle
  • Trichotillomania
• ‘Corn-row’ braiding
• Other
  • Syphilis
  • Severe illness
  • Childbirth
TELOGEN EFFLUVIUM

Clinical Presentation
- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

Pathophysiology
- variety of precipitating factors
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few months but may not be complete

ANAGEN EFFLUVIUM

Clinical Presentation
- hair loss due to insult to hair follicle impairing its mitotic activity (growth stage)

Pathophysiology
- precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

ALOPECIA AREATA

Clinical Presentation
- autoimmune disorder characterized by patches of complete hair loss often localized to scalp but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- “exclamation mark” pattern (hairs frayed and have tapered shafts, i.e. looks like "!")
- may be associated with pernicious anemia, vitiligo, thyroid disease, Addison’s disease
- spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress

Management
- generally unsatisfactory
- intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- UV or PUVA therapy
- immunomodulatory (diphenycyprone)

Scarring (Cicatricial) Alopecia

Clinical Presentation
- irreversible loss of hair follicles with fibrosis

Etiology
- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HZV)
- inflammatory
  - lichen planus (lichen planopilaris)
  - DLE (note that SLE can cause a alopecia unrelated to DLE lesions which are non-scarring)
  - morphea: “coup de sabre” with involvement of centre of scalp
- central centrifugal cicatricial alopecia (CCCA): seen in up to 40% of black women, starting at central scalp; one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population

Investigations
- biopsy from active border

Management
- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials
## Table 22 Nail Changes in Systemic and Dermatological Conditions

Pediatric Exanthems

Miscellaneous Lesions

Angioedema and Urticaria

Angioedema
- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
  - triggers minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  - non-allergic drug reaction (drugs include ACEI)
  - acquired C1 inhibitor deficiency
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

Urticaria
- also known as “hives”
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

Table 24. Classification of Urticaria

<table>
<thead>
<tr>
<th>Type</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acute Urticaria</td>
<td>Drugs: especially ASA, NSAIDs, Foods: nuts, shellfish, eggs, fruit, Idiopathic (vast majority) Infection Insect stings (bees, wasps, hornets) Perforative absorption: cosmetics, work exposures Stress Systemic diseases: SLE, endocrinopathy, neoplasm</td>
</tr>
<tr>
<td>&gt;2/3 of cases</td>
<td>Attacks last &lt;6 wk Individual lesions last &lt;24 h</td>
</tr>
<tr>
<td>Chronic Urticaria</td>
<td>IgE-dependent: trigger associated Idiopathic (90% of chronic urticaria patients) Aeroallergens Drugs (antibiotics, hormones, local anesthetics) Foods and additives Insect stings Parasitic infections Physical contact (animal saliva, plant resins, latex, metals, lotions, soap) Direct mast cell release Opiates, muscle relaxants, radio-contrast agents Complement-mediated Serum sickness, transfusion reactions Infections, viral/bacterial (&gt;80% of urticaria in pediatric patients) Urticarial vasculitis Arachidonic acid metabolism ASA, NSAIDs Physical Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), agenesis (exposure to water) adrenergic (stress), heat Other Mastocytosis, urticaria pigmentosa</td>
</tr>
<tr>
<td>&lt;1/3 of cases</td>
<td>Attacks last &gt;6 wk Individual lesions last &lt;24 h</td>
</tr>
</tbody>
</table>

Approach to Urticaria
- Thorough Hx and P/E
- Acute: no immediate investigations needed; consider referral for allergy testing
- Chronic: further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- Vasculitic: biopsy of lesion and referral to dermatology

Wheat
- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

Mastocytosis (Urticaria Pigmentosa)
- Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier’s sign), due to mast cell degranulation; this occurs within minutes
### Erythema Nodosum

**Clinical Presentation**
- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs (typically shins), knees, arms
- associated with arthralgia, fever, malaise

**Etiology**
- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, Yersinia
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

**Epidemiology**
- 15-30 yr old, F:M = 3:1
- lesions last for days and spontaneously resolve in 6 wk

**Investigations**
- chest x-ray (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

**Management**
- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause

---

### Pruritus

**Clinical Presentation**
- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

**Etiology**
- dermatologic – generalized
  - asthenic dermatitis ("winter itch" due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopc and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin's lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrotoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

**Investigations**
- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture and serology for parasites

**Management**
- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid-sparing

---

**DDx of Erythema Nodosum**

- NODOSUMM
- NO cause (idiopathic) in 40%
- Drugs (sulfonamides, OCP, etc.)
- Other infections (GAS+)
- Sarcoidosis
- UC and Crohn's
- Malignancy (leukemia, Hodgkin's lymphoma)
- Many Infections

**DDx of Pruritus**

- SCRATCHED
- Scabies
- Cholestasis
- Renal
- Autoimmune
- Tumours
- Crazies (psychiatric)
- Endocrine (polycythemia, lymphoma)
- Drugs, Dry skin

Consider biopsy of any nonhealing wound to rule out cancer.
Wounds and Ulcers

• see Plastic Surgery, PL8, PL16

Sunburn
• erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
• chronic UVA and UVB exposure leads to photoageing, immunosuppression, photocarcinogenesis
• prevention: avoid peak UVR (10 am–4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
• clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

Sunscreens and Preventative Therapy

Sunburn
• erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
• chronic UV A and UVB exposure lead to photoaging, immunosuppression, photocarcinogenesis
• prevention: avoid peak UVR (10 am–4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
• clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

Sunscreens
• under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
• topical chemical: absorbs UV light
  • requires application at least 15-30 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  • UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  • UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
• topical physical: reflects and scatters UV light
  • titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
  • all are effective against the UVA and UVB spectrum
  • less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
• some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

Management
• sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
• antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

Topical Steroids

Table 25. Potency Ranking of Topical Steroids

<table>
<thead>
<tr>
<th>Relative Potency</th>
<th>Relative Strength</th>
<th>Generic Names</th>
<th>Trade Names</th>
<th>Usage</th>

<td>Diprolene® Ultravate®</td>
</tr>
</tbody>
</table>

SPF = burn time with cream/burn time without cream

UV Radiation

UVA (320-400 nm): Aging
• Penetrates skin more effectively than UVB or UVC
• Responsible for tanning, burning, wrinkling, photodamage and premature skin aging
• Penetrates clouds, glass and is reflected off water, snow and cement

UVB (290-320 nm): Burning
• Absorbed by the outer dermis
• Is mainly responsible for burning and premature skin aging
• Primarily responsible for BCC, SCC
• Does not penetrate glass and is substantially absorbed by ozone

UVC (200-290 nm)
• Is filtered by ozone layer

Body Site:
Relative Percutaneous Absorption
Forearm 1.0
Plantar foot 0.14
Palm 0.83
Back 1.7
Scalp 3.7
Forehead 6.0
Cheeks 13.0
Scrotum 42.0

Surface Area
30 g covers full adult body once. Children have a greater surface area/volume ratio and there are consequently greater side effects

Side Effects of Topical Steroids
• Local: atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance), telangiectasia, striae, hypertrichosis, hypopigmentation
• Systemic: suppression of HPA axis
## Table 26. Common Topical Therapies

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calcipotriol (Devonex®)</td>
<td>0.005% cream, ointment, scalp solution, apply bid For maintenance therapy apply OD</td>
<td>Psoriasis</td>
<td>Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk &gt;14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)</td>
</tr>
<tr>
<td>Imiquimod (Aldara®)</td>
<td>5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wks</td>
<td>Genital warts Cutaneous warts AK Superficial BCC</td>
<td>Avoid natural/artificial UV exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion</td>
</tr>
<tr>
<td>Permethrin (Kwellada® P Lotion and Nix® Dermal Cream)</td>
<td>1% or 5% cream, applied once overnight to all skin areas from neck down, repeated one week later</td>
<td>Scabies (Kwellada P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)</td>
<td>Do not use in children &lt; 2 yr Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d</td>
</tr>
<tr>
<td>Pimecrolimus (Eidel®)</td>
<td>1% cream bid Use for as long as lesions persist and discontinue upon resolution of symptoms</td>
<td>AD (mild to moderate)</td>
<td>Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive</td>
</tr>
<tr>
<td>Tacrolimus Topical (Protopic®)</td>
<td>0.03% (children) or 0.1% (adults) ointment bid Continue for duration of disease PLUS 1 wk after clearing</td>
<td>AD (mild to moderate)</td>
<td>Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive</td>
</tr>

</table>

## Table 27. Common Oral Therapies

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acitretin (Soriatane®)</td>
<td>25-50 mg PO OD; maximum 75 mg/d</td>
<td>Severe psoriasis Other disorders of hyperkeratization (ichthyosis, Darier’s disease)</td>
<td>Monitoring strategies Monitor lipids, LF Ts at baseline and q1-2wk until stable Contraindications Women of childbearing potential unless strict contraceptive requirements are met</td>
</tr>
<tr>
<td>Antivirals</td>
<td>Famiclovir (Famvir®) 250 mg PO tid x 7-10 d (for 1st episode of genital herpes) 125 mg PO bid x 5 d (for recurrent genital herpes)</td>
<td>Chickenpox Herpes zoster Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis</td>
<td>Side effects Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function</td>
</tr>
<tr>
<td></td>
<td>Valacyclovir (Valtrex®) 1000 mg PO bid x 7-10 d (for 1st episode of genital herpes) 500 mg PO bid x 5 d (for recurrent genital herpes)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Cyclosporine (Neoral®)</td>
<td>2.5-4 mg/kg/d PO divided bid Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg q2wks Concomitant dose of magnesium may protect the kidneys</td>
<td>Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD</td>
<td>Monitoring strategies Blood pressure, renal function Contraindications Abnormal renal function, uncontrolled hypertension, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporine for &gt;2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug</td>
</tr>
<tr>
<td>Dapsone</td>
<td>50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk</td>
<td>Dermatitis herpetiformis, neutrophilic dermatoses</td>
<td>Monitoring strategies Obtain GSPD levels before initiating; in the initial two wk obtain methemoglobin levels and follow the blood counts carefully for the first few months Side effects Neutropathy Hemolysis (Vitamin C and E supplementation can help prevent this) Drug interactions Substrate of CYP2C8 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours</td>
</tr>
</tbody>
</table>
### Table 27. Common Oral Therapies (continued)

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Doxycycline</strong></td>
<td>50 mg PO bid</td>
<td>Acne vulgaris, Rosacea, Bullous pemphigoid</td>
<td>Contraindications: Pregnancy, hepatic impairment, drug hypersensitivity. Taking acitretin, isotretinoin, or penicillin antibiotic. Oral typhoid vaccine.</td>
</tr>
<tr>
<td><strong>Isotretinoin</strong></td>
<td>0.5-1 mg/kg/d given OD to achieve a total dose of 120 mg/kg (20-24 wk)</td>
<td>Severe nodular and/or inflammatory acne, Acne conglobata, Recalcitrant acne, Widespread comedonal acne</td>
<td>Monitoring strategies: Baseline lipid profile and LFTs before treatment, β-hCG. Contraindications: Teratogenic – in sexually active females, 2 forms of reliable contraception necessary. Generally regarded as unsafe in lactation. Side effects: Decreased night vision, decreased tolerance to contact lenses, dry mucous membranes. May transiently exacerbate acne, dry skin. Depression, myalgia. Drug interactions: Caution if used at the same time as tetracycline family antibiotics – both may cause pseudotumour cerebri. Discontinue vitamin A supplements.</td>
</tr>
<tr>
<td><strong>Itraconazole</strong></td>
<td>100-400 mg PO OD, depending on infection</td>
<td>Onychomycosis, Tinea corporis, cruris, versicolor, Toenails: 200 mg PO bid x 7 d once per month, repeated 2x</td>
<td>Monitoring strategies: Baseline renal, liver, and hematological studies. Contraindications: CHF. Side effects: Serious hepatotoxicity. Drug Interactions: Inhibits CYP3A4. Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs).</td>
</tr>
<tr>
<td><strong>Ivermectin</strong></td>
<td>200-250 µg/kg PO qweekly x 2</td>
<td>Onchocerciasis (USA only) Not licensed for use in Canada. Also effective for: scabies</td>
<td>No significant serious side effects. Efficacious.</td>
</tr>
<tr>
<td><strong>Methotrexate</strong></td>
<td>10-25 mg qwk, PO, IM, or IV. Max: 30 mg/vk. To minimize side effects, administer with folic acid supplementation: 1-5 mg OD</td>
<td>Psoriasis, AD, Lymphomatoid papulosis. May also be effective in: cutaneous sarcoidosis.</td>
<td>Monitoring strategies: Baseline renal, liver, and hematological studies. Contraindications: Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug. Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy. May be combined with cyclosporine to allow lower doses of both drugs.</td>
</tr>
<tr>
<td><strong>OCPs</strong></td>
<td>1 pill PO once daily</td>
<td>Hormonal acne (chin, jawline). Acne associated with polycystic ovarian syndrome or other endocrine abnormalities.</td>
<td>All combined OCPs are helpful in acne but those listed on the left have undergone RCTs. Contraindications: Smoking, HTN, migraines with aura, pregnancy. Routine gynecological health maintenance should be up to date.</td>
</tr>
<tr>
<td><strong>Spironolactone</strong></td>
<td>50-100 mg PO OD alone or with OCPs</td>
<td>Hormonal acne (chin, jawline). Acne with endocrine abnormality.</td>
<td>Contraindications: Pregnancy. Side effects: Menstrual irregularities at higher doses if not on OCPs. Breast tenderness, mild diuresis common. Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas.</td>
</tr>
<tr>
<td><strong>Terbinafine</strong></td>
<td>250 mg PO OD x 2 wk. Fingernails x 6 wk. Toenails x 12 wk. Confirm diagnosis prior to treatment</td>
<td>Onychomycosis, Tinea corporis, cruris, pedis, versicolor, capitis.</td>
<td>Contraindications: Pregnancy, chronic or active liver disease. Drug interactions: Potent inhibitor of CYP2D6; use with caution when also taking β-blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics. Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity.</td>
</tr>
<tr>
<td><strong>Tetracycline</strong></td>
<td>250-500 mg PO bid to tid; Taken 1 h before or 2 h after a meal</td>
<td>Acne vulgaris, Rosacea, Bullous pemphigoid.</td>
<td>Contraindications: Severe renal or hepatic dysfunction.</td>
</tr>
</tbody>

### Patient Assessment/Management

#### 1. Rapid Primary Survey

- Airway maintenance with C-spine control
- Breathing and ventilation
- Circulation (pulses, hemorrhage control)
- Disability (neurological status)
- Exposure (complete) and Environment (temperature control)
  - continually reassessed during secondary survey
  - changes in hemodynamic and/or neurological status necessitates a return to the primary survey beginning with airway assessment
- IMPORTANT: Always watch for signs of shock while doing primary survey
- address ng the “ABCs” is the hallmark of the emergency department
  - in the setting of cardiac arrest, the approach changes to “CABs”: chest compressions, airway, and breathing

##### A. AIRWAY

- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently
- assess for facial fractures/edema/burns (impending airway collapse)

**Airway Management**

- anatomic optimization to allow for oxygenation and ventilation

1. Basic Airway Management

- protect the C-spine
- head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

2. Temporizing Measures

- nasopharyngeal airway (if gag reflex present i.e. conscious)
- orotracheal airway (if gag reflex absent i.e. unconscious)
- “rescue” airway devices (e.g. laryngeal mask airway, Combitube®)
- transtracheal jet ventilation through cricothyroid membrane (last resort)

3. Definitive Airway Management

- ETT intubation with in-line stabilization of C-spine
  - orotracheal ± RSI preferred
  - nasotracheal may be tolerated in conscious patient
  - relatively contraindicated with basilar skull fracture
  - does not provide 100% protection against aspiration
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
- cricothyroidotomy

**Contraindications to Intubation**

- supraglottic/glottic pathology that would preclude successful intubation
**Breathing**

- **Look**
  - mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- **Feel**
  - tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

**Breathing Assessment**

- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

**Management of Breathing**

- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing FiO₂)
- Bag-Valve mask and CPAP to supplement inadequate ventilation

**Circulation**

**Definition of Shock**

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

**Causes of Shock**

- Septic, spinal/neurogenic
- Hemorrhagic
- Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
- Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
- Endocrine (e.g. Addison’s, myxedema, coma)
- Drugs

**Table 1. Major Types of Shock**

**Figure 1. Approach to endotracheal intubation in an injured patient**

BREATHING

- Look
  - mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring
- Listen
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- Feel
  - tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

**Breathing Assessment**

- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

**Management of Breathing**

- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing FiO₂)
- Bag-Valve mask and CPAP to supplement inadequate ventilation

C. CIRCULATION

**Definition of Shock**

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

**Causes of Shock**

- Septic, spinal/neurogenic
- Hemorrhagic
- Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
- Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
- Endocrine (e.g. Addison’s, myxedema, coma)
- Drugs

**Estimated Systolic Blood Pressure Based on Position of Most Distal Palpable Pulse**

<table>
<thead>
<tr>
<th>sBP (mmHg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Radial</td>
</tr>
<tr>
<td>Femoral</td>
</tr>
<tr>
<td>Carotid</td>
</tr>
</tbody>
</table>

*Note: clearing the C spine requires radiologic and clinical assessment*
Management of Hemorrhagic Shock

- clear airway and breathing either first or simultaneously
- apply direct pressure on external wounds while elevating ex remities. Do not remove impaled objects in the emergency room setting as they may tamponade bleeds
- start TWO LARGE BORE (14-16G) IVs in the brachial/cephalic vein of each arm
- run 1-2 L bolus of IV Normal Saline/Ringer’s Lactate (warmed, if possible)
- if continual bleeding or no response to crystalloids, consider PRBC transfusion, ideally crossmatched. If crossmatched blood is unavailable, consider O- for women of childbearing age and O+ for men. Use FFP, platelets or tranexamic acid in early bleeding
- consider common sites of internal bleeding (abdomen, chest, pelvis, long bones) where surgical intervention may be necessary

D. DISABILITY

- assess LOC using GCS
- pupils
  - assess equality, size, symmetry, reactivity to light
  - inequality/sluggish suggests local eye problem or lateralizing CNS lesion
  - relative afferent pupillary defect (swinging light test) – optic nerve damage
  - extraocular movements and nystagmus
  - fundoscopy (papilledema, hemorrhages)
  - reactive pupils + decreased LOC: metabolic or structural cause
  - non-reactive pupils + decreased LOC: structural cause (especially if asymmetric)

Glasgow Coma Scale

- for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated; change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3 part score: Eyes + Verbal + Motor = Total
- if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

3:1 Rule
Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss

Fluid Resuscitation

- Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
  - 0-10 kg: 4 cc/kg/h
  - 10-20 kg: 2 cc/kg/h
  - Remaining weight: 1 cc/kg/h
- Replace ongoing losses and deficits (assume 10% of body weight)

E. EXPOSURE/ENVIRONMENT

- expose patient completely and assess entire body for injury; log roll to examine back
- DRE
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

2. Resuscitation

- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP, and O2 monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

</tbody>
</table>

#### Compressions

- **Compression landmarks**
  - In the centre of the chest, between nipples
  - Just below nipple line
- **Compression method:** push hard and fast, and allow for complete recoil
  - 2 hands: heel of 1 hand with second hand on top
  - 2 hands: heel of 1 hand with second on top, or 1 hand: heel of 1 hand only
  - 2 fingers, or thumbs
- **Compression depth**
  - 2-2.4 inches
  - About ½ to ½ the depth of the chest
- **Compression rate**
  - 100-120/min with complete chest wall recoil between compressions
- **Compression-ventilation ratio**
  - 30 compressions to 2 ventilations
- **Compression-only CPR**
  - Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only

#### Defibrillation

- Immediate defibrillation for all rescuers responding to a sudden witnessed collapse
- Compressions (5 cycles/2 min) before AED is considered if unwitnessed arrest
- Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available

### 3. Secondary Survey

- done after primary survey once patient is hemodynamically and neurologically stabilized
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, and pelvis – required in blunt trauma, consider T-spine and L-spine if indicated)

**HISTORY**

- "SAMPLE": Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

---

![Figure 2: Four areas of a FAST](https://via.placeholder.com/150)
PHYSICAL EXAM

Head and Neck
• palpation of facial bones, scalp

Chest
• inspect for: 1. midline trachea and 2. flail segment: ≥2 rib fractures in ≥2 places; if present look for associated hemothorax, pneumothorax, and contusions
• auscultate lung fields
• palpate for subcutaneous emphysema

Abdomen
• assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
• DRE for GI bleed, high riding prostate, and anal tone

Musculoskeletal
• examine all extremities for swelling, deformity, contusions, tenderness, ROM
• check for pulses (using Doppler probe) and sensation in all injured limbs
• log roll and palpate thoracic and lumbar spines
• palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

Neurological
• GCS
• full cranial nerve exam
• alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
• assess spinal cord integrity
• conscious patient: assess distal sensation and motor function
• unconscious patient: response to painful or noxious stimulus applied to extremities

INITIAL IMAGING
• non-contrast CT head/face/C-spine (rule out fractures and bleeds)
• chest x-ray
• FAST (see Figure 2) or CT abdomen/pelvis (if stable)
• pelvis x-ray

Ethical Considerations

Consent to Treatment: Adults
• see Ethical, Legal, and Organizational Medicine, ELOM7
• Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  • assumes that most people would want to be saved in an emergency
  • any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
  • exceptions to the Emergency Rule – treatment cannot be initiated if
    • a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient’s wishes have changed
    • an advanced directive is available (e.g. do not resuscitate order)
  • NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
  • if in doubt, initiate treatment
  • care can be withdrawn if necessary at a later time or if wishes are clarified by family

Consent to Treatment: Children
• treat immediately if patient is at imminent risk
• parents/guardians have the right to make treatment decisions
• if parents refuse treatment that is life-saving or will potentially alter the child’s quality of life, CAS must be contacted – consent of CAS is needed to treat

Other Issues of Consent
• need consent for HIV testing, as well as for administration of blood products
• however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

Duty to Report
• law may vary depending on province and/or state
• examples: gunshot wounds, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others
Traumatology

- **epidemiology**
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined

- **trimodal distribution of death**
  - minutes: death usually at the scene from lethal injuries
  - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, etc

- **injuries fall into two categories**
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

Considerations for Traumatic Injury

- important to know the mechanism of injury to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

<table>
<thead>
<tr>
<th>Table 5. Mechanisms and Considerations of Traumatic Injuries</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mechanism of Injury</strong></td>
</tr>
<tr>
<td>-------------------------</td>
</tr>
<tr>
<td>MVC</td>
</tr>
<tr>
<td>Pedestrian-Automobile Impact</td>
</tr>
<tr>
<td>Falls</td>
</tr>
</tbody>
</table>

Head Trauma

- see Neurosurgery, NS30
- 60% of MVC-related deaths are due to HI

Specific Injuries

- fractures
  - Dx: non-contrast head CT and physical exam
  - A. skull fractures
    - vault fractures
      - linear, non-depressed
        - most common
        - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
    - depressed
      - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
    - basal skull fractures
      - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
      - clinical diagnosis superior as poorly visualized on CT
  - B. facial fractures (see Plastic Surgery, PL31)
    - neuronal injury
    - beware of open fracture or sinus fractures (risk of infection)
    - severe facial fractures may pose risk to airway from profuse bleeding

Signs of Basal Skull Fracture

- Battle’s sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea

Cardiac Box: sternal notch, nipples, and xiphoid process; injuries inside this area should increase suspicion of cardiac injury

High Risk Injuries

- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height >12 ft (3.6 m)

Vehicle vs. Pedestrian Crash

In adults look for triad of injuries (Waddle’s triad)

- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

Always completely expose and count the number of wounds
scalp laceration
- can be a source of significant bleeding
- achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)

neuronal injury
A. diffuse
- mild TBI = concussion
- transient alteration in mental status that may involve loss of consciousness
- hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
- loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
- diffuse axonal injury
  - mild: coma 6-24 h, possibly lasting deficit
  - moderate: coma >24 h, little or no signs of brainstem dysfunction
  - severe: coma >24 h, frequent signs of brainstem dysfunction
B. focal injuries
- contusions
- intracranial hemorrhage (epidural, subdural, intracerebral)

ASSESSMENT OF BRAIN INJURY

History
- pre-hospital status
- mechanism of injury

Physical Exam
- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing’s response to increasing ICP (bradycardia, HTN, irregular respiration)
- severity of injury determined by
  1. LOC
    - GCS ≤8 intubate, any change in score of 3 or more = serious injury
    - mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
    - may become subtler with increasing severity of injury
- reassess frequently

Investigations
- labs: CBC, electrolytes, PT/PTT or INR/PTT, glucose, toxicology screen
- CT scan head and neck (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging

Management
- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
- seizure treatment/prophylaxis
  - benzodiazepines, phenytoin, phenobarbital
  - steroids are of no proven value
- treat suspected raised ICP, consider if HI with signs of increased ICP:
  - intubate
  - calm (sedate) if risk for high airway pressures or agitation
  - paralyze if agitated
  - hyperventilate (100% O₂) to a pCO₂ of 30-35 mmHg
  - elevate head of bed to 20°
  - adequate BP to ensure good cerebral perfusion
  - diurese with mannitol 1g/kg infused rapidly (contraindicated in shock/renal failure)

Disposition
- neurosurgical ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits

Warning Signs of Severe Head Injury
- GCS <8
- Deteriorating GCS
- Unequal pupils
- Lateralizing signs

N.B. Altered LOC is a hallmark of brain injury

Canadian CT Head Rule
Lancet 2001;357:1391-96
CT Head is only required for patients with minor HI with any one of the following
High Risk (for neurological intervention)
- GCS score <15 at 2 h after injury
- Suspected open or depressed skull fracture
- Any sign of basal skull fracture (hemotympanum, “raccoon” eyes, CSF otorrhea/rhinorrhea, Battle’s sign)
- Vomiting ≥2 episodes
- Age ≥65 yr
Medium Risk (for brain injury on CT)
- Amnesia before impact >30 min (i.e. cannot recall events just before impact)
- Dangerous mechanism (pedestrian struck by MVC, occupant ejected from motor vehicle, fall from height >3 ft or five stairs)

Minor HI is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.

NB: Canadian CT Head Rule does not apply for non-trauma cases, for GCS<13, age <16, for patients on Coumadin® and/or having a bleeding disorder, or having an obvious open skull fracture.
**Mild Traumatic Brain Injury**

**Epidemiology**
- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see *Neurosurgery*, NS30)
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

**Clinical Features**
- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

**Etiology**
- falls, MVC, struck by an object, assault, sports

**Investigations**
- neurological exam
- concussion recognition tool (see thinkfirst.ca)
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

**Treatment**
- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- early rehabilitation to maximize outcomes
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

**Prognosis**
- most recover with minimal treatment
- athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

**Spine and Spinal Cord Trauma**
- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (see Figure 1)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

**History**
- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

**Physical Exam**
- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
  - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
  - extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

**Investigations**
- bloodwork: CBC, electrolytes Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
  - thoracolumbar x-rays
  - AP and lateral views
• indications
  • C-spine injury
  • unconscious patients (with appropriate mechanism of injury)
  • neurological symptoms or findings
  • deformities that are palpable when patient is log rolled
  • back pain
  • bilateral calcaneal fractures (due to fall from height)
  – concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
  • consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate

**Approach to clearing the C-spine**

**Suspected C-Spine Injury**

**History:** midline neck pain, numbness or paresthesia, presence of distracting pain, head injury, intoxication, loss of consciousness or past history of spinal mobility disorder

**Physical exam:** posterior neck spasm, tenderness or crepitus; any neurologic deficit or autonomic dysfunction, altered mental state

1. Plain x-rays, 3 views
   - Normal films
   - Abnormal films
   1. Flexion/extension films
   2. MRI
   - Normal neurological exam
   - Abnormal neurological exam
   - C-spine cleared

2. CT scan if
   - C-spine cleared
   - Neck pain
   1. Normal films
   2. Abnormal films
   - C-spine cleared
   - MRI

**Management of Cord Injury**

- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- high dose steroids: methylprednisolone 30 mg/kg bolus, then 5.4 mg/kg/h drip, start within 6-8 h of injury (controversial and recently has less support)
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transsection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact but loss of innervation of intercostals and other accessory muscles of breathing)
  - high cervical cord injury (above C4) may require intubation and ventilation
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

**Approach to C-Spine X-Rays**

- 3-view C-spine series is the screening modality of choice
  1. lateral C1-T1 ± swimmer’s view
  2. odontoid view (open mouth or oblique submental view)
- examine the dens for fractures
  - if unable to rule out fracture, repeat view or consider CT or plain film tomography
- examine lateral aspects of C1 and spacing relative to C2

---

**The Canadian C-Spine Rule**

*JAMA* 2001;286:1841-48

For Alert (GCS Score = 15) and Stable Trauma Patients where C-Spine Injury is a Concern

1. Any high-risk factor that mandates radiography?
   - Age <65 yr
   - Dangerous mechanism
   - Paralysis in extremities
   - No
   - Radiography

2. Any low-risk factor that allows safe assessment of ROM?
   - Simple rear-end MVC
   - Sitting postion in ED
   - Ambulatory at any time
   - Delayed onset of neck pain
   - Absence of midline C-spine tenderness
   - No
   - No radiography

3. Able to actively rotate neck?
   - >45º left and right
   - Yes
   - No radiography

*Dangerous Mechanism:
  • Fall from ≥1 meter/5 stairs
  • Axial load to head (e.g. diving)
  • MVC >60 km/h, rollover, ejection
  • Motorized recreational vehicles
  • Bicycle collision

Simple rear-end MVC excludes:
- Pushed into oncoming traffic
- Hit by bus/long truck
- Robber
- Hit by high-speed vehicle
- Delayed: not immediate onset of neck pain

---

**Lines of contour on a lateral C-spine x-ray**

© Kim Auchinachie

1. Anterior vertebral line
2. Posterior vertebral line (anterior margin of spinal canal)
3. Posterior border of facets
4. Laminar fusion line (posterior margin of spinal canal)
5. Posterior spinous line (along tips of spinous processes)

Prevertebral soft tissue swelling is only 49% sensitive for injury
3. AP view

- alignment of spinous processes in the midline
- spacing of spinous processes should be equal
- check vertebral bodies and facet dislocations

Table 6. Interpretation of Lateral View: The ABCS

<table>

Sequelaes of C-Spine Fractures

- see Neurosurgery, NS34
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
  - decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
  - watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
  - occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
  - provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
  - signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
  - common triggers:
    - GU causes: bladder distention, urinary tract infection, and kidney stones
    - GI causes: fecal impaction or bowel distension
  - treatment: monitoring and controlling BP, prior to addressing causative issue

Chest Trauma

- two types: those found and managed in 1° survey and those found and managed in 2° survey

Penetrating Neck Trauma
- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR
Airway Injuries
• always maintain a high index of suspicion
• larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
  - triad: hoarseness, subcutaneous emphysema, palpable fracture
  - other symptoms: hemoptysis, dyspnea, dysphonia
  - investigations: CXR, CT scan, arteriography (if penetrating)
  - management
    - airway: manage early because of edema
    - C-spine may also be injured, consider mechanism of injury
    - surgical: tracheotomy vs. repair
• trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intra-thoracic pressure, complaints of dyspnea, hemoptysis
  - examination: subcutaneous air, Hamman's sign (crunching sound synchronous with heart beat)
  - CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
  - management: surgical repair if >1/3 circumference

Abdominal Trauma
• two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = 2nd)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

BLUNT TRAUMA
• results in two types of hemorrhage: intra-abdominal and retroperitoneal
• adopt high clinical suspicion of bleeding in multi-system trauma

History
• mechanism of injury, SAMPLE history

Physical Exam
• often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - tachycardia, tachypnea, oliguria, febrile, hypotension
  - other injuries may mask symptoms
  - serial examinations are required
• abdomen
  - inspect: contusions, abrasions, seat-belt sign, distention
  - auscultate: bruises, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG, Foley catheter should be considered part of the abdominal exam
  - other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

Investigations
• labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β-hCG, U/A, toxicology screen

</tbody>
</table>

If Penetrating Neck Trauma Present, DON'T:
• clamp structures (can damage nerves)
• probe
• insert NG tube (leads to bleeding)
• remove weapon/impaled object

Criteria for Positive Lavage
• ≥10 cc gross blood
• bile, bacteria, foreign material
• RBC count >100,000 x 10^6/L
• WBC >500 x 10^3/L
• Amylase >175 IU

Seatbelt Injuries May Cause
• Retroperitoneal duodenal trauma
• Intraperitoneal bowel transection
• Mesenteric injury
• L spine injury

Indications for Foley and NG Tube in Abdominal Trauma
Foley catheter: unconscious or patient with multiple injuries who cannot void spontaneously or is unconscious NG tube: used to decompress the stomach and proximal small bowel. Contraindicated if suspected facial or basal skull fractures

Figure 6. Zones of the neck in trauma
imaging must be done if:
- equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
- unexplained shock/hypotension
- patients have multiple traumas and must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
- fractures of lower ribs, pelvis, spine
- positive FAST

Management
- general: ABCs, fluid resuscitation, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

**Penetrating Trauma**
- high risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

Management
- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds always require laparotomy

**Genitourinary Tract Injuries**
- see Urology, U32

Etiology
- blunt trauma: often associated with pelvic fractures
  - upper tract
    - renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ureter: rare, at uretero-pelvic junction
  - lower tract
    - bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
  - penetrating trauma
    - damage to: kidney, bladder, ureter (rare), external genitalia
  - acceleration/deceleration injury
    - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
  - iatrogenic
    - ureter and urethra (from instrumentation)

History
- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

Physical Exam
- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures

Laparotomy is Mandatory if Penetrating Trauma and:
- shock
- peritonitis
- evisceration
- free air in abdomen
- blood in NG tube, Foley catheter, or on DRE

“Rule of Thirds” for Stab Wounds
- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

Gross hematuria suggests bladder injury
Investigations
• urethra: retrograde urethrography
• bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
• ureter: retrograde ureterogram
• renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

Management
• urology consult
• renal
  • minor injuries: conservative management
    • bedrest, hydration, analgesia, antibiotics
  • major injuries: admit
    • conservative management with frequent reassessments, serial U/A ± re-imaging
    • surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
• ureter
  • ureteroureterostomy
• bladder
  • extraperitoneal
    • minor rupture: Foley drainage x 10-14 d
    • major rupture: surgical repair
  • intraperitoneal
    • drain abdomen and surgical repair
• urethra
  • anterior: conservative, if cannot void, Foley or suprapubic cystostomy and antibiotics
  • posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

Orthopedic Injuries
• see Orthopedics (see Shoulder OR10, Knee OR31, Wrist OR20, Ankle OR37)

Goals of ED Treatment
• diagnose potentially life/limb threatening injuries
• reduce and immobilize fractures (cast/splint) as appropriate
• provide adequate pain relief
• arrange proper follow-up if necessary

History
• use SAMPLE, mechanism of injury may be very important

Physical Exam
• look (inspection): “SEADS” swelling, erythema, atrophy, deformity, and skin changes (e.g. bruises)
• feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, and subtle deformity
• move: joints affected plus those above and below injury – active ROM preferred to passive
• neurovascular status: distal to injury (before and after reduction)

LIFE- AND LIMB-THREATENING INJURIES

Table 10. Life- and Limb-Threatening Orthopedic Injuries

<table>
<thead>
<tr>
<th>Life-Threatening Injuries (usually blood loss)</th>
<th>Limb-Threatening Injuries (usually interruption of blood supply)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major pelvic fractures</td>
<td>Fracture/dislocation of ankle (talar AVN)</td>
</tr>
<tr>
<td>Traumatic amputations</td>
<td>Crush injuries</td>
</tr>
<tr>
<td>Massive long bone injuries and associated fat emboli syndrome</td>
<td>Compartment syndrome</td>
</tr>
<tr>
<td>Vascular injury proximal to knee/elbow</td>
<td>Open fractures</td>
</tr>
<tr>
<td></td>
<td>Dislocations of knee/hip</td>
</tr>
<tr>
<td></td>
<td>Fractures above knee/elbow</td>
</tr>
</tbody>
</table>

Open Fractures
• communication between fracture site and external surface of skin – increased risk of osteomyelitis
• remove gross debris, irrigate cover with sterile dressing – formal irrigation and debridement often done in the OR
• control bleeding with pressure (no clamping)
• splint
• antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
• standard of care is to secure definitive surgical management within 6 h, time to surgery may vary from case-to-case
Vascular Injuries
- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

Compartment Syndrome
- when the intracompartmental pressure within an anatomical area (e.g. forearm or lower leg) exceeds the capillary perfusion pressure, eventually leading to muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - tense compartment
  - look for “the 6 Ps” (note radial pulse pressure is 120/80 mmHg while capillary perfusion pressure is 30 mmHg, seeing any of the 6ps indicates advanced compartment syndrome, therefore do not wait for these signs to diagnose and treat)
- requires prompt decompression: remove constrictive casts, dressing; emergent fasciotomy may be needed

UPPER EXTREMITY INJURIES
- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
  - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopedics
  - with forceful injury, look for fracture
- Colles’ fracture
  - distal radius fracture with dorsal displacement from “Fall on Outstretched Hand” (FOOSH)
  - AP film: shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with orthopedics or immediate orthopedic referral if complicated fracture
  - if involvement of articular surface, emergent orthopedic referral
- scaphoid fracture
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
  - risk of AVN of scaphoid if not immobilized
  - outpatient orthopedics follow-up

LOWER EXTREMITY INJURIES
- ankle and foot fractures
  - see Ottawa Ankle and Foot Rules
- knee injuries
  - see Ottawa Knee Rules
  - avulsion of the base of 5th metatarsal
  - occurs with inversion injury
  - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated injuries may involve ankles, knees, hips, pelvis, lumbar spine

A knee x-ray examination is required only for acute injury patients with one or more of:
- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)

Wound Management

Goals of ED Treatment
• identify injuries and stop any active bleeding – direct pressure
• manage pain
• wound examination and exploration (history and physical)
• cleansing ± antibiotic and tetanus prophylaxis
• closure and dressing

Tetanus Prophylaxis
• both tetanus toxoid (Td) and immunoglobulin (TIG) are afe in pregnancy

Table 11 Guidelines for Tetanus Prophylaxis for Wounds

<table>
<thead>
<tr>
<th>Vaccination History</th>
<th>Clean, Minor Wounds</th>
<th>All Other Wounds*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unknown or fewer than 3 doses</td>
<td>Tdap or Td⁰</td>
<td>TIG</td>
</tr>
<tr>
<td>3 or more doses</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns, and frostbite

Tdap is preferred to Td for adults who have never received Tdap. Single antigen tetanus toxoid (TT) is no longer available in the United States

Yes, if more than ten years since the last tetanus toxoid-containing vaccine dose

Yes, if more than five years since the last tetanus toxoid-containing vaccine dose

Bruises
• non-palpable = ecchymosis
• palpable collection (not swelling) = hematoma following blunt trauma
• assess for coagulopathy (e.g. liver disease), anticoagulant use

Abrasions
• partial to full thickness break in skin
• management
• clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antisepptic ointment (Polysporin* or Vaseline*) for 7 d for facial and complex abrasions
• tetanus prophylaxis

Lacerations
• see Plastic Surgery, PL8
• consider every structure deep to a laceration injured until proven otherwise
• in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury

An ankle radiographic series is required only if there is any pain in malleolar zone and any of these findings:
1. Bony tenderness at A or
2. Bony tenderness at B or
3. Inability to bear weight both immediately and in ED

A radiographic series is required only if there is any pain in midfoot zone and any of these findings:
1. Bony tenderness at C or
2. Bony tenderness at D or
3. Inability to bear weight both immediately and in ED

Suture Use and Duration

<table>
<thead>
<tr>
<th>Suture to:</th>

<td>Scalp</td>
<td>4-0</td>
<td>7</td>
</tr>
</tbody>
</table>

Mucous Membrane absorbable (vicryl)/N/A

N.B. Patients on steroid therapy may need sutures for longer periods of time
• physical exam
  • think about underlying anatomy
  • examine tendon function actively against resistance and neurovascular status distally
  • clean and explore under local anesthetic; look for partial tendon injuries
  • x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radioopaque), or if suspect intra-articular involvement
• management
  • disinfect skin/use sterile techniques
  • irrigate copiously with normal saline
  • analgesia ± anesthetics
    • 7 mg/kg with epinephrine
    • 5 mg/kg without epinephrine
  • in children, topical anesthetics such as LET (lidocaine, epinephrine, and tetracaine), and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
  • secure hemostasis
  • evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
  • ± prophylactic antibiotics (consider for animal/human bites, intra-oral lesion, or puncture wounds to the foot)
  • suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury, or retained foreign body
  • take into account patient and wound factors when considering suturing
  • advise patient when to have sutures removed
  • cellulitis and necrotizing fasciitis (see Plastic Surgery, PL15)

Approach to Common ED Presentations

Abdominal Pain

</tbody>
</table>

• differential can be focused anatomically by location of pain: RUQ, LUQ, RLQ, LLQ, epigastric, periumbilical, diffuse

History
• pain: OPQRST
• review symptoms from GU, gynecological, GI, respiratory, and CV systems
• abdominal trauma/surgeries, most recent colonoscopy

Physical Exam
• vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

Investigations
• ABCs, do not delay management and consultation if patient unstable
• labs: CBC, electrolytes, glucose, BUN/Cr, U/A ± liver enzymes, LFTs, lipase, β-hCG, ECG, troponins, ± VBG/lactate
• AXR: look for calcifications, free air, gas pattern, air fluid levels
• CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
• U/S: biliary tract, ectopic pregnancy, AAA, free fluid
• CT: trauma, AAA, pancreatitis, nephro-/ureolithiasis appendicitis, and diverticulitis

Early wound irrigation and debridement are the most important factors in decreasing infection risk

Alternatives to Sutures
• Tissue glue
• Steristrips®
• Staples

Be vigilant: very young, elderly, alcoholics, immunosuppressed patients often present atypically
Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have an increased level of suspicion for an intra-abdominal process in these individuals

Unstable patients should not be sent for imaging

If elevated AST and ALT
Think hepatocellular injury
AST > ALT: alcohol-related
ALT > AST: viral, drug, toxin

If elevated ALP and GGT
Think biliary tree obstruction
**Management**
- NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: general surgery, vascular surgery, gynecology, etc

**Disposition**
- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

---

**Acute Pelvic Pain**

**Etiology**
- gynecological
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID, endometriosis
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse non-gynecological (see causes of lower abdominal pain above)

**History and Physical Exam**
- pain: OPQRST
- associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel and/or bladder symptoms
- pregnancy and sexual history
- vitals
- gynecological exam: assess for cervical motion tenderness/"chandelier sign" (suggests PID)
- abdominal exam

**Investigations**
- β-hCG for all women of childbearing age
- CBC and differential, electrolytes, glucose, Cr, BUN, G&S, PTT/INR
- urinalysis to rule out urologic causes
- vaginal and cervical swabs for C&S during physical exam
- pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
- Doppler flow studies for ovarian torsion

**Management**
- general: analgesia, determine if admission and consults are needed
- specific:
  - ovarian cysts
    - unruptured or ruptured, and hemodynamically stable: analgesia and follow-up
    - ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  - PID: broad spectrum antibiotics

**Disposition**
- referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

---

**Altered Level of Consciousness**

**Definitions**
- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see Psychiatry, PS19)
  - dementia (see Psychiatry, PS20)
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness
MANAGEMENT OF ALTERED LOC

History
- obtain collateral from family, friends, police, paramedics, old chart, MedicAlert® bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/schemia or cardiac cause
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode(s), depression, overdose)

Physical Exam
- ABCs, vitals including temperature; cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes ("PEARL" pupils equal and reactive to light)
- use the GCS to evaluate LOC (see Initial Patient Assessment/Management, ER2)

Investigations
- blood work
  - rapid blood sugar, CBC, electrolytes, Cr, BUN, LFTs, glucose, serum osmolality, VBG, PT/PTT/INR, troponins
  - serum EtOH, acetaminophen, and salicylate levels
- imaging
  - CXR, CT head
- other tests
  - ECG, U/A, UTox

Diagnosis
- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - one ampule D50W IV if hypoglycemic on finger-prick
  - naloxone 0.4-2 mg IV or IM if opiate overdose suspected
- distinguish between structural and toxic-metabolic coma
  - structural coma
    - pupils, extracocular movements, and motor findings, if present, are usually asymmetric
    - look for focal or lateralizing abnormalities
  - toxic-metabolic coma
    - dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 13)
    - extracocular movements and motor findings are symmetric or absent
- essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")
Table 13. Toxic-Metabolic Causes of Fixed Pupils

<table>
<thead>
<tr>
<th>Dilated</th>
<th>Dilated to Normal</th>
<th>Constricted</th>
</tr>

<td>Hallucinogens</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Disposition
- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

Table 14. Differential Diagnosis for Chest Pain

<table>
<thead>
<tr>
<th>Emergent</th>
<th>Usually Less Emergent</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVS</td>
<td>MI, unstable angina, aortic dissection, cardiac tamponade, arrhythmia</td>
</tr>
<tr>
<td>Respiratory</td>
<td>PE, pneumothorax</td>
</tr>
<tr>
<td>GI</td>
<td>Esophageal rupture, pneumomediastinum</td>
</tr>
<tr>
<td>MSK</td>
<td></td>
</tr>
<tr>
<td>Other</td>
<td></td>
</tr>
</tbody>
</table>

History and Physical Exam
- OPQRST, previous episodes and change in pattern
- cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
- vitals, cardiac, respiratory, peripheral vascular, abdominal exams

Investigations
- CBC, electrolytes, Cr, BUN, glucose, PTT/INR, cardiac biomarkers (troponins, CK)
- ECG: always compare with previous; may be normal in up to 50% of PE and acute MI
- CXR: compare with previous
- CT: if indicated (e.g. aortic dissection, PE)

Management and Disposition
- ABCs, O2, cardiac monitors, IV access
- treat underlying cause and involve consultants as necessary
- consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up and instruct to return if SOB or increased chest pain develops

Life-Threatening Causes of Chest Pain
- PET MAP
- PE
- Esophageal rupture
- Tamponade
- MI/angina
- Aortic dissection
- Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of BP

Angina Characteristics
- 1. Retrosternal location
- 2. Provoked by exertion
- 3. Relieved by rest or nitroglycerin

Risk for CAD
- 3/3 = "typical angina" - high risk
- 2/3 = intermediate risk for women >50 yr, all men
- 1/3 = Intermediate risk in men >40 yr, women >60 yr
### Table 15. Comparison of Chest Pain Diagnoses

<table>
<thead>
<tr>
<th>Diagnosis</th>
<th>Classic History</th>
<th>Classic Findings</th>
<th>Diagnostic Investigations</th>
<th>Management and Disposition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Acute Coronary Syndrome</strong></td>
<td>New or worsening pattern of retrosternal squeezing/pressure pain, radiation to arm/neck, dyspnea, worsened by exercise, relieved by rest. N/V, syncope</td>
<td>New or worsened murmur, hypotension, diaphoresis pulmonary edema</td>
<td>ECG: ischemia (15-lead if hypotensive, AV node involvement or inferior MI), serial troponin I (sensitive 6-8 h after onset), CK-MB, CK</td>
<td>ABCs, aspirin, anticoagulation and emergent cardiology consult to consider percutaneous intervention or thrombolytic</td>
</tr>
<tr>
<td><strong>Pulmonary Embolism</strong></td>
<td>Pleuritic chest pain (75%), dyspnea; risk factors for venous thromboembolism</td>
<td>Tachycardia, hypoxemia; evidence of DVT</td>
<td>Wells’ criteria: D-dimer, CT pulmonary angiogram*, V/G scan, leg Doppler, CXR</td>
<td>ABCs, anticoagulation; consider airway management and thrombolysis if respiratory failure</td>
</tr>
<tr>
<td><strong>Aortic Dissection</strong></td>
<td>Sudden severe tearing retrosternal or midscapular pain ± focal pain/neurologic loss in extremities in context of HTN</td>
<td>HTN; systolic BP difference &gt; 20 mmHg or pulse deficit between arms; aortic regurgitant murmur</td>
<td>CT angiography; CXR: PA, lateral, expiratory views — lung edge, loss of lung markings, tracheal shift; deep sulcus sign on supine view</td>
<td>ABCs, rule out MI, high dose NSAIDs ± colchicine; consult if chronic/recurrent or non-viral cause (e.g. SLE, renal failure, requires surgery)</td>
</tr>
<tr>
<td><strong>Cardiac Tamponade</strong></td>
<td>Dyspnea, cold extremities, ± chest pain; often a recent cardiac intervention or symptoms of malignancy, connective tissue disease</td>
<td>Beck’s triad — hypotension, elevated JVP, muffled heart sounds; tachycardia, pulsus paradoxus &gt; 10 mmHg</td>
<td>Clinical diagnosis: CXR: PA, lateral, expiratory views — lung edge, loss of lung markings, tracheal shift; deep sulcus sign on supine view</td>
<td>ABCs, cardiac surgery consult; pericardiocentesis if unstable, treat underlying cause</td>
</tr>
<tr>
<td><strong>Esophageal Rupture</strong></td>
<td>Sudden onset severe pain after endoscopy, forceful vomiting, labour, or convulsion, or in context of corrosive injury or cancer</td>
<td>Subcutaneous empyema, findings consistent with sepsis</td>
<td>Clinical diagnosis: CXR: pleural effusion (75%), pneumomediastinum; CT or water soluble contrast esophagram</td>
<td>ABCs, early antibiotics, resuscitation, thoracics consult, NPO, consider chest tube</td>
</tr>
<tr>
<td><strong>Esophagitis or GERD</strong></td>
<td>Frequent heartburn, acid reflux, dysphagia, relief with antacids</td>
<td>None</td>
<td>None acutely</td>
<td>ABCs, PPI, avoid EOH, tobacco, trigger foods</td>
</tr>
<tr>
<td><strong>Herpes Zoster</strong></td>
<td>Abnormal skin sensation – itching/tingling/pain – preceding rash by 1-5 d</td>
<td>None if early; maculopapular rash developing into vesicles and pustules that crust</td>
<td>Clinical diagnosis; direct immunofluorescence assay</td>
<td>ABCs, anti-viral, analgesia ± steroids, dressing; r/o ocular involvement/refer if necessary</td>
</tr>
<tr>
<td><strong>MSK</strong></td>
<td>History of injury</td>
<td>Reproduction of symptoms with movement or palpation (not specific – present in 25% of MI)</td>
<td>MSK injury or fracture on X-rays</td>
<td>ABCs, NSAIDs, rest, orthopedics consultation for fractures</td>
</tr>
<tr>
<td><strong>Anxiety</strong></td>
<td>Symptoms of anxiety, depression, history of psychiatric disorder; may coexist with physical disease</td>
<td>Tachycardia, diaphoresis, tremor</td>
<td>Diagnosis of exclusion</td>
<td>ABCs, arrange social supports, rule out suicidality and consider psychiatry consult</td>
</tr>
</tbody>
</table>

*Addition of Clopidogrel to Aspirin® and Fibinolytic Therapy for Myocardial Infarction with ST-Segment Elevation

NEJM 2005;352:1179–91

**Purpose:** To assess the benefit of adding clopidogrel to Aspirin® and fibrinolytic therapy in ST-elevation MI.

**Methods:** Double-blind, RCT of Individuals presenting within 12 h of onset of ST-elevation MI, comparing clopidogrel (300 mg loading dose followed by 75 mg QD until day of angiogram) versus placebo, in addition to Aspirin®, a fibrinolytic agent, and heparin when appropriate. Primary outcome was composite of occluded infarct-related artery on angiography (thrombosis in MI flow grade 0 or 1), or death or recurrent MI prior to angiography. Follow-up was to 30 days. Analysis was by intention to treat.

**Results:** 3,491 patients were included (mean age 57, 80.3% male, 50.3% smokers, 9.1% previous MI). Rates of the primary endpoint were 21.7% in the placebo group and 15.0% in the clopidogrel group (95% CI 24-47%). Among the individual components of the primary endpoint, clopidogrel had a significant effect on the rate of an occluded infarct-related artery and the rate of recurrent MI, but no effect on the rate of death from any cause. At 30 clinical follow-up, there was no difference in rate of death from cardiovascular causes, a significant reduction in the odds of recurrent MI, and a non-significant reduction in recurrent ischemia with need for urgent revascularization. The rates of major bleeding and intracranial hemorrhage were similar between the two groups.

**Conclusion:** Addition of clopidogrel improves the potency rate of infarct-related arteries and reduces ischemic complications, both of which are associated with improved long-term survival after MI. The trial was not powered to detect a survival benefit, and none was seen.

**Signs of PE on CXR**

**Westermark’s sign:** abrupt tapering of a vessel on chest film

**Hampton’s hump:** a wedge-shaped infiltrate that abuts the pleura

**Effusion, atelectasis, or infiltrates 50% normal**

**Tracheal deviation is away from tension or towards non-tension pneumothorax**

**Headache**

- see Neurology, N44

**Etiology**

- **common and less serious**
  - common migraine (without aura)/classic migraine (with aura)
    - common: unilateral, throbbing, aggravated by activity, moderate/severe, N/V, photo-/phonophobia
    - classic: varied aura symptoms, e.g. flashing lights, pins and needles (paresthesia), loss of vision, dysarthria
    - abortive treatment: fluids, NSAIDs, antiepileptic drugs, vasoactive medications
    - family doctor to consider prophylactic treatment
  - tension/muscular headache
    - mild-moderate headache with gradual onset lasting minutes to days
    - bilateral-frontal or nuchal-occipital
    - increased with stress, sleep deprivation
    - treatment: modify stressor(s), local measures, NSAIDs, tricyclic antidepressants

- **less common but potentially fatal**
  - subarachnoid hemorrhage (SAH) (see Neurosurgery, NS18)
    - sudden onset, “worst headache of life,” maximum intensity within minutes
    - increased pain with exertion, N/V, meningeval signs
    - diagnosis
      - new generation CT 100% sensitive within 6 h of onset (hyperattenuating signal around Circle of Willis)
      - LP if suspected SAH and normal CT after 6 h
    - management: urgent neurosurgery consult

**Immediate Treatment of Acute MI**

BEMOAN
- β-blocker
- Enoxaparin
- Morphine
- Oxygen
- ASA
- Nitroglycerin

**Common Therapeutic Approach to Severe Migraine**

- 1 L bolus of NS
- prochlorperazine 10 mg IV
- diphenhydramine 25 mg IV
- ketorolac 30 mg IV
- dexamethasone 10 mg IV
- Other options include haloperidol, metoclopramide, ergotamine, sumatriptan, analgesics

**Ottawa SAH Rule**

JAMA 2013;310(12): 1248-55

- Use for alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h
- Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumours, or history of recurrent headaches (>3 episodes over the course of ≥6 mo)
- Investigate if ≥1 high-risk variables present:
  - Age ≥40 yr
  - Neck pain or stiffness
  - Witnessed loss of consciousness
  - Onset during exertion
  - Thunderclap headache (instantly peaking pain)
  - Limited neck flexion on examination
- Subarachnoid hemorrhage can be predicted with 100% sensitivity using this rule.

**Meningitis**

- Do not delay IV antibiotics for LP
- Deliver first dose of dexamethasone with or before first dose of antibiotic therapy
• increased ICP
• worse in morning, when supine or bending down, with cough or valsalva
• physical exam: neurological deficits, cranial nerve palsies, papilledema
• diagnosis: CT head
• management: consult neurosurgery
• meningitis (see Infectious Diseases, JD18)
• flu-like symptoms (fever, N/V, malaise), meningeal signs, petechial rash
• altered LOC and confusion
• rule out increased ICP; if CT head or normal mental status, no neurological signs and no papilledema, then do LP for diagnosis
• treatment: early empiric antibiotics ± acyclovir, steroid therapy
• temporal arthritis (causes significant morbidity, blindness) (see Ophthalmology, OP35)
• vasculitis of large and mid-sized arteries, gender 3:1 F:M, most commonly age >70 yr
• headache, scalp tenderness, jaw claudication, arthralgia, myalgia, fever, malaise or weight loss
• temporal artery tender on palpation, relative afferent pupillary defect (RAPD), optic disc edema on fundoscopy
• labs: elevated ESR, CRP
• temporal artery biopsy is gold standard for diagnosis
• associated with polymyalgia rheumatica
• treatment: high-dose steroids immediately if suspected, no need to hold treatment until pathology results

Disposition
• admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atyypical presentation), or if pain is refractory to oral medications
• discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

Joint Pain and Back Pain

JOINT PAIN (see Rheumatology, RI3)

rule out life threatening causes: septic joint (see Orthopedics, OR10)

History and Physical Exam
• associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
• patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
• inflammatory symptoms: morning stiffness ≥30 min, pain/stiffness that ease with activity, midday fatigue, soft tissue swelling
• non-inflammatory symptoms: morning stiffness <30 min, stiffness short-lived after inactivity, increasing pain with activity
• assess ROM, localized joint pain, effusion, erythema, warmth, swelling with pain on active ROM, inability to bear weight, fever; may indicate presence of septic joint

Investigations
• blood work: CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate
• joint x-ray ± contralateral joint for comparison
• bedside US to identify effusion
• test joint aspirate for: WBC, protein, glucose, Gram stain, crystals

Management
• septic joint: IV antibiotics ± joint decompression and drainage
• antibiotics can be started empirically if septic arthritis cannot be ruled out
• crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
• do not use allopurinol, as it may worsen acute attack
• acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
• osteoarthritis: NSAIDs, acetylsalicylic acid
• soft tissue pain: allow healing with enforced rest ± immobilization
• non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
• pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

BACK PAIN (see Family Medicine, FM38)

rule out vascular emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed
rule out spinal emergencies using red flags (see sidebar): osteomyelitis, cauda equina, epidural abscess or hematoma
evaluate risk for fracture (osteoporosis, age), infection (IV drug user recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors)
typical benign back pain is moderate, dull, aching, worse with movement or cough
palpate spine for bony tenderness, precordial, respiratory, abdominal and neurological exams guided by history
reserve imaging for suspicion of emergencies, metastases, and patients at high risk of fracture, infection, cancer, or vascular causes

Which Patients can Safely Undergo Lumbar Percutaneous Needle Biopsy Without Screening CT?

Purpose: To investigate whether the absence of certain clinical features at baseline may be used to identify adults with suspected meningitis who are unlikely to have abnormal computed tomography (CT) findings.
Methods: Adults with suspected meningitis seen in the Emergency Department were prospectively studied. Baseline features for the following characteristics were collected: sociodemographic characteristics, co-existing conditions (based on Clarion clinically relevant), presence/absence of neuroimaging, specific clinical features, neurological abnormalities, laboratory results and management decisions. CT was performed, and results were interpreted in duplicate by staff radiologists and neuroradiologists aware of the patients' clinical findings.
Results: 351 adults with suspected meningitis were included, of which 235 underwent a CT head scan prior to a lumbar puncture. Baseline clinical features associated with abnormal CT findings were an age of 65 years or older, immunosuppressed state, history of current or previous cerebrovascular disease, and history of cancer or infection. On multivariate analysis, the following variables were identified as independent predictors of abnormal CT findings: age ≥ 70 years (OR: 2.57, 95% CI: 1.36 to 4.86), immunosuppression (OR: 2.64, 95% CI: 1.31 to 5.33) and recent infection (OR: 5.06, 95% CI: 2.31 to 10.93). The sensitivity of the CT head scan was normal in 89% of the 165 patients (negative predictive value 97%).
Conclusion: It is safe to avoid a CT scan in patients with selected clinical features who are unlikely to have abnormal CT findings.

Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache
BMJ 2015;356:g4761

Purpose: To examine effectiveness of parenteral corticosteroids for the prevention of acute severe migraine headache and prevention of recurrent headaches.
Methods: Meta-analysis of RCTs comparing corticosteroids (alone or in combination with standard abortive therapy) to placebo or any other standard treatment for acute migraine in adults.
Results: Seven RCTs met eligibility criteria, all of which used standard abortive therapy and subsequently compared a single dose of parenteral dexamethasone to placebo. At trials examined pain relief and recurrence of headache within 72 h. All 7 trials demonstrated dexamethasone was associated with statistically significant reduction in pain relief at 2 h (OR: 0.37, 95% CI: 0.24 to 0.56) and side effect profiles, dexamethasone provided lower recurrence rates (relative risk 0.69, 95% CI: 0.60 to 0.80; number needed to treat 9).
Conclusion: Single dose parenteral dexamethasone is standard abortive therapy is associated with a 30% relative reduction in headache recurrence within 72 h.

CT Head within 6 h ± 100% Sensitivity for Diagnosis of Subarachnoid Hemorrhage (SAH)
BMJ 2012;343:d4277

Purpose: To measure the sensitivity of CT in emergency patients being evaluated for possible SAH, particularly when carried out within 6 h of headache onset.
Methods: A prospective multicentre cohort study was conducted in 11 tertiary and emergency departments across Canada to measure the sensitivity of CT head in the evaluation of ED patients for SAH. Neurologically intact adults were screened with a new onset non-traumatic headache meeting maximal intensity in less than one hour who had head CT as part of their diagnostic workup to rule out SAH were considered eligible. Patients were deemed positive for SAH if there was subarachnoid blood on CT, suturectomies in the C-spine or CT of blood cells in the final level of CFT collected. Some patients with normal results on CT received IV dexamethasone as a result of the treating physician's subjective judgment. Patients with a negative result on CT and a plausible cause for the headache identified through questioning patients were followed for six months to characterize their outcome. Primary outcome was CT results interpreted by a staff radiologist.
Results: 1,158 adults were enrolled (median age 45 yr; 1:2.57 (72.5%) reporting worst headache ever). Overall sensitivity of CT head within 6 h of headache onset was 93% (93% CI: 92% to 94%). Specificity was 99% (99% CI: 99% to 100%). Negative predictive value was 99.99% (99.99% CI: 99.98% to 100%). Positive predictive value was 99.99% (99.99% CI: 99.99% to 100%). For patients scanned within 6 h of symptom onset (n = 172), sensitivity was 99% (99% CI: 99% to 100%). Specificity was 100% (95% CI: 100% to 100%). Negative predictive value was 100% (99.99% CI: 100% to 100%) and positive predictive value was 100% (99.99% CI: 100% to 100%).
Conclusion: CT within 6 h is highly sensitive in identifying subarachnoid hemorrhage when it is causal and within 6 h after headache onset and interpreted by a qualified radiologist.
Management
• treat underlying cause
• lumbosacral spine and disc herniation: analgesia and continue daily activities as much as tolerated; discuss red flags and organize follow-up
• spinal infection: early IV antibiotics and ID consultation
• cauda equina: dexamethasone, early neurosurgical consultation

Seizures
• see Neurology, N18

Definition
• paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
• status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness (life threatening)

Categories
• generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
• partial seizure (focal): simple partial, complex partial
• causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP) metabolic disturbance (hypo-/hyperglycemia, hypo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
• differential diagnosis: syncope, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy, myoclonus

History
• from patient and bystander: flaccid and unconscious, often with deep rapid breathing
• preceding aura, rapid onset, loss of bladder/bowel control, tongue-biting (sides of the tongue)
• length of seizure and post-ictal symptoms (e.g. cognitive impairments, migraine, focal symptoms: aphasia, hemiparesis)

Physical Exam
• injuries to head and spine and bony prominences (e.g. elbows), tongue laceration, aspiration, urinary incontinence

Table 17 Concurrent Investigation and Management of Status Epilepticus

<table>
<thead>
<tr>
<th>Timing</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediate</td>
<td>Protect airway with positioning; intubate if airway compromised or elevated ICP  Monitor: vital signs, ECG, oximetry; bedside blood glucose  Establish IV access  Benzodiazepine - IV lorazepam 0.1 mg/kg up to 4 mg/dose at 2 mg/min preferred over IV diazepam 0.15 mg/kg up to 10 mg/dose at 5 mg/min; repeat at 5 min if ineffective  Fluid resuscitation  Give 50 mL 50% glucose (preceded by thiamine 100 mg IM in adults)  Obtain blood samples for glucose, CBC, electrolytes, Ca++, Mg++, toxins, and antiepileptic drug levels; consider prolactin, β-hCG  Vasopressor support if sBP &lt; 90 or MAP &lt; 70 mmHg</td>
</tr>
<tr>
<td>Urgent</td>
<td>Establish second IV line, urinary catheter  If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 min after loading infusion  If seizure resolves, antiepileptic drug still required to prevent recurrence  EEG monitoring to evaluate for non-convulsive status epilepticus</td>
</tr>
<tr>
<td>Refractory</td>
<td>If status persists after maximum doses above, consult ICU and start one or more of:  Phenobarbital 20 mg/kg IV at 50 mg/min  Midazolam 0.2 mg/kg IV loading dose and 0.05-0.5 mg/kg/h  Propofol 2-5 mg/kg IV loading dose then 2-10 mg/kg/h</td>
</tr>
<tr>
<td>Post-Seizure</td>
<td>Investigate underlying cause: consider CT, LP, MRI, intracranial pressure monitoring</td>
</tr>
</tbody>
</table>

Note: All interventions should be done as soon as possible
Adapted from Brophy et al. Guidelines for the Evaluation and Management of Status Epilepticus. Neurocrit Care 2012;17:3-23

Disposition
• decision to admit or discharge should be based on the underlying disease process identified
• if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
• first-time seizure patients being discharged should be referred to a neurologist for follow-up
• admitted patients should generally have a neurology consult
• patient should not drive until medically cleared (local regulations vary)
• complete notification form to appropriate authority regarding ability to drive
• warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)
Shortness of Breath

- see Respirology, R3 and Cardiology and Cardiac Surgery, C5

### History and Physical Exam
- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
- wheeze and stridor (airway) vs. crackles (parenchymal), JVP, and murmurs

### Investigations
- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - Wells scores to consider appropriateness of D-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (i.e. PE)

### Management of Life-Threatening Dyspnea NYD
- see Primary and Secondary Surveys, ER2-3
- treat underlying cause

### Disposition
- the history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
- consider intubation in CO2 retainers (e.g. COPD)
- if discharging, organize follow-up and educate regarding signs to return to hospital

### Syncope

**Definition**
- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system hypoperfusion

**Etiology**
- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)
History
- gather details from witnesses, and clarify patient’s experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation
- distinguish between syncope and seizure (see Neurology, N19)
  - some patients may have myoclonic jerks with syncope – NOT a seizure
  - signs and symptoms during presyncope, syncope, and postsyncope
- past medical history, drugs
- think anatomically in differential; pump (heart), blood vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
- syncope is accompanied by chest pain

Physical Exam
- postural BP and HR
- cardiac, respiratory, and neurological exams
- examine for signs of secondary injury caused by syncopal episode (e.g. head injury)

Investigations
- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval, Brugada Syndrome, RV strain), bedside glucose
- consider blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, Ca²⁺, Mg²⁺, β-hCG, D-dimer
- consider toxicology screen

Management
- ABCs, IV, O₂, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

Disposition
- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow-up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate patient for fitness to drive or work
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

Sexual Assault

Epidemiology
- 1 in 4 women and 1 in 10 men will be sexually assaulted in their lifetime; only 7% are reported

General Approach
- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (legally required)

History
- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
  - gravidity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

Physical Exam
- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)
pelvic exam and specimen collection
  • ideally before urination or defecation
  • examine for seminal stains, hymen, signs of trauma
  • collect moistened swabs of dried seminal stains
  • pubic hair combings and cuttings
  • speculum exam
    • lubricate with water only
    • vaginal lacerations, foreign bodies
    • Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
    • posterior fornix secretions if present or aspiration of saline irrigation
    • immediate wet smear for motile sperm
    • air-dried slides for immotile sperm, acid phosphatase, ABO group
  • fingernail scrapings and saliva sample from victim

Investigations
  • Venereal Disease Research Lab (VDRL): repeat in 3 mo if negative
  • serum β-hCG
  • blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

Management
  • involve local/regional sexual assault team
  • medical
    • suture lacerations, tetanus prophylaxis
    • gynecology consult for foreign body, complex lacerations
    • assume positive for gonorrhea and chlamydia
      • management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 7 d) and cefixime 800 mg PO x 1 dose (alt: ceftriaxone 250 mg IM x 1 dose)
      • may start prophylaxis for hepatitis B and HIV
      • pre and post counselling for HIV testing
      • pregnancy prophylaxis offered
        • levonorgestrel 0.75 mg PO STAT, repeat within 12 h (Plan B’)
  • psychological
    • high incidence of psychological sequelae
    • have victim change and shower after exam completed

Disposition
  • discharge if injuries/social situation permit
  • follow up with physician in rape crisis centre within 24 h
  • best if patient does not leave ED alone

DOMESTIC VIOLENCE
  • women are usually the victims, but male victimization also occurs
  • identify the problem (need high index of suspicion)
    • suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
    • somatic symptoms (chronic and vague complaints)
    • psychosocial symptoms
      • clinician impression (your ‘gut feeling’, e.g. overbearing partner that won’t leave patient’s side)
  • if disclosed, be supportive and assess danger
  • patient must consent to follow-up investigation/reporting (unless for children)

Management
  • treat injuries and document findings
  • ask about sexual assault and children at home (encourage notification of police)
  • safety plan with good follow-up with family physician/social worker

Medical Emergencies

Anaphylaxis and Allergic Reactions

Etiology
• anaphylaxis is an exaggerated immune mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
• allergic (re-exposure to allergen)
• non-allergic (e.g. exercise induced)
**Diagnostic Criteria**

- **anaphylaxis** is highly likely with any of:
  1. acute onset of an illness (min to hrs) with involvement of the skin, mucosal tissue and at least one of:
     - respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
     - hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. two or more of the following after exposure to a LIKELY allergen for that patient (min to hrs)
     - involvement of the skin-mucosal tissue
     - respiratory compromise
     - hypotension or associated symptoms
     - persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. hypotension after exposure to a KNOWN allergen for that patient (min to hrs)
     - management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
     - life-threatening differentials for anaphylaxis include asthma and septic shock
     - angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

**Management**

- **moderate reaction:** generalized urticaria, angioedema, wheezing, tachycardia
  - epinephrine (1:1000) 0.3-0.5 mg (IM in lateral thigh)
  - antihistamines: diphenhydramine (Benadryl®) 25-50 mg IM
  - salbutamol (Ventolin®) 1 cc via MDI
- **severe reaction/evolution:** severe wheezing, laryngeal/pulmonary edema, shock
  - ABCs, may need definitive airway (e.g. ETT) due to airway edema
  - epinephrine (1:1000) 0.1-0.3 mg IV (or via ETT if no IV access) to start, repeat as needed
  - antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
  - corticosteroids: hydrocortisone (Solucortef®) 100 mg IV (~1.5 mg/kg) or methylprednisolone (Solumedrol®) 1 mg/kg IV q6h x 24 h
  - large volumes of crystalloid may be required

**Disposition**

- monitor for 4-6 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 48 h later, patient may need to be supervised
- educate patient on avoidance of allergens
  - H1 antagonist (cetirizine 10 mg PO OD or Benadryl 50 mg PO q4-6h x3d)
  - H2 antagonist (ranitidine 150 mg PO OD x3d)
  - corticosteroid (prednisone 50 mg PO OD x5d) to prevent secondary reaction

**Asthma**

- see Respiriology, R7
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

**History and Physical**

- find cause(s) of asthma exacerbation (viral, environmental, etc.)
- history of asthma control; severity of exacerbations (ICU, intubation history)
- signs of respiratory distress
- vitals, specifically $O_2$

**Investigations**

- peak flow meter
- ± ABG if in severe respiratory distress
- CXR if diagnosis in doubt to rule out pneumonia, pneumothorax, etc.
Table 19. Asthma Assessment and Management

</tbody>
</table>

**Disposition**

- discharge safe in patients with FEV1 or PEF > 60% predicted, and may be safe if FEV1 or PEF 40-60% predicted based on patient’s risk factors for recurrence of severe attack
- risk factors for recurrence: frequent ED visits, frequent hospitalizations, recent steroid use, recent exacerbation, poor medication compliance, prolonged use of high dose β-agonists
- β-agonist MDI with aerochamber 2-4 puffs q2-4h until symptoms controlled, then prn
- initiate inhaled corticosteroids with aerochamber if not already prescribed
- if moderate to severe attack, administer prednisone 30-60 mg/d for 7 d with no taper
- counsel on medication adherence and educate on use of aerochamber
- follow-up with primary care physician or asthma specialist

### Cardiac Dysrhythmias

- **see Cardiology and Cardiac Surgery, C16**

### Bradydysrhythmias and AV Conduction Blocks

- **AV conduction blocks**
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
  - atropine and transcatheter pacing (atropine with caution)
  - if transcatheter pacing fails consider IV dopamine, epinephrine
  - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker

- **sinus bradycardia** (rate <60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, calcium channel blockers)
  - treat if symptomatic (hypotension, chest pain)
  - acute: atropine ± transcatheter pacing
  - sick sinus: transcatheter pacing
  - drug induced: discontinue/reduce offending drug, consider antidotes

### Supraventricular Tachydysrhythmias (narrow QRS)

- **sinus tachycardia** (rate >100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider β-blocker if symptomatic

- **regular rhythm** (i.e. not sinus tachycardia)
  - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
  - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
  - monitor for recurrence
  - treat recurrence with adenosine or longer acting medications
  - rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
  - rate control (diltiazem, β-blockers) and consult cardiology

- **irregular rhythm**
  - probable AFib, atrial flutter, or multifocal atrial tachycardia
  - rate control (diltiazem, β-blockers)
Atrial Fibrillation
- most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday hear), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
  - if unstable: immediate synchronized cardioversion
  - if onset of Afib is >48 h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion, or do transesophageal echocardiogram to rule out clot
  - if onset <48 h or already anticoagulated: may cardiovert
  - electrical cardioversion: synchronized direct current (DC) cardioversion
  - chemical cardioversion: procainamide, lithium, propafenone
- long-term management: rate or rhythm control, consider anticoagulation (CHADS2 score, see Cardiology and Cardiac Surgery, C20)

Ventricular Tachydysrhythmias (wide QRS)
- VTach (rate usually 140-200 bpm)
  - definition: 3 or more consecutive ventricular beats at >100 bpm
  - etiology: CAD with MI is most common cause
  - treatment: sustained VTach (>30 s) is an emergency
    - hemodynamic compromise: synchronized DC cardioversion
    - no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
- VFib: call a code blue, follow ACLS for pulseless arrest
- Torsades de pointes
  - looks like VTach but QRS ‘rotates around baseline’ with changing axis and amplitude (twisted ribbon)
  - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  - treatment
    - IV Mg²⁺, temporary overdrive pacing, isoproterenol
    - correct cause of prolonged QT

Acute Exacerbation of COPD (AECOPD)
- for chronic management of COPD see Respirology, R9
- progressive development of irreversible airway obstruction, typically caused by smoking

History and Physical Exam
- cardinal symptoms of AECOPD: increased dyspnea, increased coughing frequency or severity, increased sputum volume or purulence
- triggers: virus, pneumonia, urinary tract infection, PE, CHF, MI, drugs
- characterize previous episodes and hospitalizations, smoking history
- vital signs, LOC, signs of respiratory distress, respiratory exam

Investigations
- CBC, electrolytes, ABG, CXR, ECG
- PFTs are NOT useful in managing acute exacerbations

Management
- oxygen: keep O₂ sat 88-92% (be aware when giving O₂ to chronic hypercapnic/CO₂ retainers but do not withhold O₂ if hypoxic)
- bronchodilators: short-acting β-agonist (salbutamol 4-8 puffs via MDI with spacer q15min x 3 prn) ± short-acting anticholinergic (ipratropium 4-8 puffs via MDI q15min x 3 prn)
- steroids: prednisone 40-60 mg PO for 7-14 d, or methylprednisolone 125 mg IV bid-qid if severe exacerbation, or unable to take PO
- antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (given if all 3 cardinal symptoms present or 2 cardinal symptoms with increased sputum purulence or mechanical ventilation)
- ventilation: apply noninvasive positive-pressure ventilation (CPAP or BiPAP) if severe distress or signs of fatigue, arterial pH <7.35, or hypercapnic
- if life-threatening, ICU admission for intubation and ventilation (chance of ventilation dependency)

Disposition
- no guidelines for admission - based on clinical judgement and comorbidities
- lower threshold to admit if comorbid illness (diabetes, CHF, CAD, alcohol abuse)
- if discharging, use antibiotics, taper steroids, up to 4-6 puffs qid of ipratropium and salbutamol and organize follow-up
**Acute Decompensated Heart Failure (ADHF)**

- for chronic management of CHF [see Cardiology and Cardiac Surgery, C36]

**Etiology**
causes of CHF: decreased myocardial contractility (ischemia, infarction, cardiomyopathy, myocarditis), pressure overload states (HTN, valve abnormalities, congenital heart disease), restricted cardiac output (myocardial infiltrative disease, cardiac tamponade)

- precipitants of acute decompensation of CHF
  - cardiac (ischemia, infarction, arrhythmia - Afib)
  - medications (β-blockers, CCBs, NSAIDs, steroids, non-compliance)
  - dietary (increased sodium and/or water intake)
  - high output (anemia, infection, pregnancy, hyperthyroid)
  - other (renal failure, hypertensive crisis, iatrogenic fluid overload - blood transfusions or IV fluids)

**Presentation**
- left-sided heart failure
  - dyspnea, SOB, orthopnea, PND, nocturia, fatigue, altered mental status, presyncope/syncope, angina, systemic hypotension
  - hypoxia, decreased air entry to lungs, crackles, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation and positive AJR, ascites, hepatomegaly
- patients often present with a combination of right-sided and left-sided symptoms

**Investigations**
- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR: most useful test (see sidebar)
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion), LVH, atrial enlargement, conduction abnormalities
- ABG: if severe or refractory to treatment
  - hypoxemia, hypercapnia, and acidosis are signs of severe CHF
- echocardiogram: not usually used in emergency evaluation, previous results may aid in diagnosis
- rule out serious differentials: PE, pneumothorax, pneumonia/empyema, acute exacerbations COPD

**Management**
- ABCs, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter (to follow effectiveness of diuresis)
- 100% O2 by mask
- if poor response, may require BiPAP or intubation
- medical
  - diuretic (if volume overloaded): furosemide 40-80 mg IV
  - vasodilators (if sBP >100): nitroglycerin 0.3 mg SL q5min ± topical Nitrodur* patch (0.4-0.8 mg/h)
    - if not responding or signs of ischemia (angina): nitroglycerine 10-20 µg/min IV, titrate to response
    - if severe or refractory hypertension: nitroprusside 0.5 µg/kg/min, titrate to response
  - inotropes/vasopressors (if sBP <90)
    - without signs of shock: dobutamine 2.5 µg/kg/min IV, titrate up to sBP >90 mmHg
    - with signs of shock: dopamine 5-10 µg/kg/min IV, titrate up to sBP >90 mmHg
- treat precipitating factor - e.g. rate control (β-blocker, calcium channel blockers) or rhythm-control (electrical or chemical cardioversion) if new Afib
- cardiology or medicine consult

**Hospital Management Required if**
- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring intervention
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

**Precipitants of CHF Exacerbation**

| FAILURE |
|---|---|
| F | Forgot medication |
| A | Arrhythmia (Dysrhythmia)/Anemia |
| I | Ischemia/Infarction/Infection |
| L | Lifestyle (e.g. high salt intake) |
| U | Uptregulation of cardiac output |
| R | Renal failure |
| E | Embolism (pulmonary) |

**CHF on CXR**

- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions
- Peribronchial cuffing
- Fissural thickening (fluid in fissure)

**Acute Treatment of CHF**

| LMNOP |
|---|---|
| L | Lasix® (furosemide) |
| M | Morphine |
| N | Nitroglycerin |
| O | Oxygen |
| P | Position (sit upright), Pressure (BiPAP) |

**Hospital Management Required if**

- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring intervention
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen
Venous Thromboembolism (VTE)

- see Respirology, R20

Risk Factors
- Virchow’s triad: alterations in blood flow (venous s asis), injury to endothelium, hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors (see sidebar)

DEEP VEIN THROMBOSIS (DVT)

Presentation
- calf pain, unilateral leg swelling/erythema/edema, palpable cord along the deep venous system on exam; can be asymptomatic
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

Investigations
- use Wells’ criteria for DVT to guide investigations (see Figure 12)
- D-dimer is only useful at ruling out DVT if it’s negative in low-moderate risk patients (highly sensitive)
  - high risk of false positives in: elderly, infection, recent surgery, trauma, hemorrhage, late in pregnancy, liver disease, cancer
  - U/S has high sensitivity & specificity for proximal clot but only 73% sensitivity for calf DVT (may need to repeat in 1 wk)
  - if positive – treat for DVT regardless of risk
  - if negative and low risk – rule out DVT
  - if negative and moderate to high risk – repeat U/S in 5-7 d to rule out DVT

Management
- LMWH unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24h or enoxaparin 1.5 mg/kg SC q24h
  - warfarin started at same time as LMWH (5 mg PO OD initially followed by dosing based on INR)
  - LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
  - DOAC can be used in acute management of symptomatic DVT
    - apixaban: 15 mg PO bid for first 21 d; 20 mg PO daily for remaining treatment (taken with food at the same time each day)
    - rivaroxaban: 15 mg PO bid for first 7 d; 5 mg PO bid for remaining treatment
    - consider thrombolyis if extensive DVT causing limb compromise
    - IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
    - duration of anticoagulation: 3 mo if transient coagulopathy; 6 mo if unprovoked DVT; life-long if ongoing coagulopathy

PULMONARY EMBOLISM (PE)

Presentation
- dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

Investigations
- use Wells’ criteria for PE to guide investigations (see Figure 13)
- PERC score alone can rule out PE in low risk patients (as determined by Wells’ criteria) unless patient is pregnant
- ECG and CXR are useful to rule out other causes (e.g. ACS, pneumonia, pericarditis) or to support diagnosis of PE
  - ECG changes in PE: sinus tachycardia, right ventricular strain (S1Q3T3), T wave inversions in anterior and inferior leads
  - CXR findings in PE: Hampton’s hump (triangular density extending from pleura) or Westermark’s sign
- D-dimer is only useful at ruling out a PE if it is negative in low-moderate risk patients (highly sensitive)
  - if positive D-dimer or high-probability patient, then pursue CT angiography or V/Q scan
- CT angiography has high sensitivity and specificity for PE, may also suggest other etiology
- V/Q scan useful in pregnancy, when CT angiography not available, or IV contrast contraindicated

Management of PE
- treatment of PE with anticoagulation and duration of treatment is the same as for DVT (see above)
- consider thrombolysis if extensive PE causing hemodynamic compromise or cardiogenic shock
- catheter-directed thrombolysis or surgical thrombectomy rarely considered in massive PE or contraindication to anticoagulation
- often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O2, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
- referral to medicine for coagulopathy and malignancy workup

</tbody>
</table>

PERC Score

- Age >50 yr
- HR >100 bpm
- O2 sat on RA <94%
- Prior history DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score >3 means patient has <1.5% chance having a PE and avoids further investigation. Caution using the PERC score in pregnant women as the original study excluded pregnant women.

D-dimer is only useful if it is negative; negative predictive value >99%
Diabetic Emergencies

• Diabetic Ketoacidosis
  • triad of hyperglycemia, ketosis, and acidosis due to severe insulin deficiency and counter regulatory hormone excess
  • clinical presentation
    • often young, Type 1 DM patients, (may rarely be first presentation of undiagnosed Type 2 DM) with symptoms evolving within a day
    • early signs and symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
    • late signs and symptoms
      ■ GI: anorexia, nausea, vomiting, abdominal pain
      ■ neurological: fatigue, drowsiness, stupor, coma
      ■ respiratory: Kussmaul's respiration, dyspnea (often due to acidosis), fruity ketotic breath
  • investigations
    • blood work: CBC, electrolytes, Ca++, Mg++, PO43-, Cr, BUN, glucose, ketones, osmolality, AST/ALT/ALP, amylase, troponin
    • urine: glucose and ketones
    • ABG or VBG
    • ECG (MI is possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
  • management
    • rehydration
      • bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in pediatric patients)
      • beware of a pseudohyponatremia due to hyperglycemia (add 3 Na+ per 10 glucose over 5.5 mmol/L)
  • potassium
    • essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial K+ <5.5 mmol/L)
    • use cardiac monitoring if potassium levels normal or low

Oral Rivaroxaban for the Treatment of Symptomatic Pulmonary Embolism

Purpose: To compare the efficacy and safety of rivaroxaban alone as anticoagulation therapy for PE.  
Methods: A randomized, open-label, event-driven, non-inferiority trial was undertaken to compare rivaroxaban (10 mg twice daily for 3 wk, followed by 20 mg once daily) with standard therapy of enoxaparin followed by an adjusted-dose vitamin K antagonist, in patients with PE.  
Results: 3,432 patients were enrolled. Rivaroxaban was non-inferior to standard therapy (non-inferiority margin, 2.0; p=0.003) for preventing recurrent VTE (HR: 1.92; 95% CI 1.07-3.48). Major bleeding occurred less in the rivaroxaban group (hazard ratio, 0.49; 0.31-0.76; p=0.003). Rates of other adverse events were similar in the two groups.  
Conclusions: A fixed-dose regimen of rivaroxaban alone was non-inferior to standard therapy for the initial and long-term treatment of PE.
- insulin
  - critical, as this is the only way to turn off gluconeogenesis/ketosis
  - do not give insulin if K⁺ < 3.3 mmol/L.
  - initial bolus of 5-10 U short-acting/regular insulin (or 0.2 U/kg) IV in adults (controversial – may just start with infusion)
  - followed by continuous infusion at 5-10 U (or 0.1 U/kg) per h
  - once the blood glucose < 14 mmol/L, patient should receive their regular insulin SC injection and the infusion stopped in 1 h
  - add D5W to IV fluids when blood glucose < 15 mmol/L to prevent hypoglycemia
- bicarbonate is not given unless patient is at risk of death or shock (typically pH < 7.0)

**Hyperosmolar Hyperglycemic State**
- state of extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, counter-regulatory hormones excess, gluconeogenesis, and dehydration (due to osmotic diuresis)
- often older, Type 2 DM patients with more co-morbid illnesses and larger fluid losses with symptoms evolving over days to weeks, less GI symptoms and more neurological deficits than DKA including: mental disturbances, coma, delirium, seizures
- polyuria, N/V
- investigations
  - blood work: CBC, electrolytes, Ca²⁺, Mg²⁺, PO₄³⁻, Cr, BUN, glucose, ketones, osmolality
  - urine: glucose and ketones
  - ABG or VBG
  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - O₂ and cardiac monitoring, frequent electrolyte and glucose monitoring
  - insulin is controversial
  - identify and treat precipitant if present (the 5 Is)

**Hypoglycemia**
- characterized by Whipple's triad: low plasma glucose, symptoms suggestive of hypoglycemia, prompt resolution of symptoms with glucose
- clinical presentation
  - neuroglycopenic symptoms: headaches, confusion, seizures, coma
  - autonomic symptoms: diaphoresis, nausea, hunger, tachycardia, palpitations
- history and physical exam
  - last meal, known DM, prior similar episodes, drug therapy, and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
- management
  - IV access and rapid blood glucose measurement
  - D50W 50 mL IV push, glucose PO if mental status permits
  - if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
  - O₂, cardiac, frequent blood glucose monitoring
  - thiamine 100 mg IM
  - full meal as soon as mental status permits
  - if episode due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long t½ (may require admission for monitoring)
  - search for cause (most often due to exogenous insulin, alcohol, or sulfonylureas)
**Electrolyte Disturbances**

- see Nephrology, NP7 and Endocrinology, E36

<table>
<thead>
<tr>
<th>Electrolyte Disturbance</th>
<th>Common Causes</th>
<th>Symptoms</th>
<th>Treatment</th>
<th>Special Considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypernatremia</td>
<td>Inadequate H₂O intake (elderly/disabled) or inappropriate excretion of H₂O (diuretics, Li, and DI)</td>
<td>Lethargy, weakness, irritability, and edema; seizures and coma occur with severe elevations of Na⁺ levels (&gt;158 mmol/L)</td>
<td>Salt restrict and give free water</td>
<td>No more than 12 mmol/L in 24 h drop in Na⁺ (0.5 mmol/L/h) due to risk of cerebral edema, seizures, death</td>
</tr>
<tr>
<td>Hyponatremia</td>
<td>Hypovolemic (GI renal, skin, blood fluid loss), euovolemic (SIADH/stress, adrenal insufficiency, hypothyroid, diet/intake), hypervolemic (CHF, cirrhosis, nephrotic syndrome)</td>
<td>Neurologic symptoms 2° to cerebral edema, headache, decreased LOC depressed reflexes; chronic milder than acute</td>
<td>Water restrict/NPD; Seizure/Coma: 100 cc 3% NaCl; Treat hypovolemic with RL and hypervolemic with furosemide</td>
<td>Limit total rise to 8 mmol/L in 24 h (0.5 mmol/L/h maximum) as patients are at risk of central pontine myelolysis</td>
</tr>
<tr>
<td>Hyperkalemia</td>
<td>Rhabdomyolysis, insulin deficiency, metabolic acidosis (e.g. acute renal failure, missed dialysis)</td>
<td>Nausea, palpitations, muscle stiffness, areflexia</td>
<td>Protect heart: calcium gluconate; Shift K⁺ into cells: D50W + Insulin, NaHCO₃, salbutamol; Remove K⁺: Fluids + furosemide, dialysis</td>
<td>High risk of dysrhythmia - ECG: peaked/narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, AV block, VFib</td>
</tr>
<tr>
<td>Hypokalemia</td>
<td>Metabolic alkalosis (e.g. diarhoea), insulin, diuretics, anorexia, salbutamol</td>
<td>N/V, fatigue, muscle cramps, constipation</td>
<td>K-Dur³, K⁺ sparing diuretics, IV solutions with 20-40 mEq/L KCl over 3-4 h</td>
<td>ECG: U waves most important, flattened/inverted T waves, prolonged QT, depressed ST; May need to restore Mg²⁺</td>
</tr>
<tr>
<td>Hypercalcemia</td>
<td>Hyper-PTH and malignancy account for ~90% of cases</td>
<td>Multisystem including CVS, GI (gastrointestinal), MSK (bones), psychiatric (mood)</td>
<td>Isotonic saline (+ furosemide if hypervolemic); Bisphosphonates, dialysis, chelation (EDTA or oral PDi³)</td>
<td>Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy</td>
</tr>
<tr>
<td>Hypocalcemia</td>
<td>Iatrogenic, low Mg²⁺; liver dysfunction, 1° hypo-PTH</td>
<td>Laryngospasm, hyperreflexia, paresthesia, tetany, Chvostek’s and Trouseau’s sign</td>
<td>Acute (ionized Ca²⁺ &lt;0.7 mM) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion</td>
<td>Prolonged QT interval can arise, leading to dysrhythmia as can upper airway obstruction</td>
</tr>
</tbody>
</table>

**Hypertensive Emergencies**

- definition: severe elevation of BP with evidence of end-organ damage (CNS, retinal, CVS, renal, GI) etiology
  - essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), etc.
- preeclampsia
- HELLP Syndrome (seen only in preeclampsia/ eclampsia)
- Hemolytic anemia
- Elevated Liver enzymes
- Low Platelet count

**Table 21. Signs and Symptoms of Hypertensive Emergencies**

<table>
<thead>
<tr>
<th>CNS</th>
<th>Retinal</th>
<th>Renal</th>
<th>Cardiovascular</th>
<th>Gastrointestinal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complication</td>
<td>Stroke/TIA, headache, altered mental status, seizures, hemorrhage</td>
<td>Vision change, hemorrhage, exudates, papilledema</td>
<td>Nectaria, elevated Cr, proteinuria, hematuria, oliguria</td>
<td>Ischemia/angina, infarction, dissection (back pain), CHF</td>
</tr>
</tbody>
</table>

- investigations
  - blood work: CBC, electrolytes, BUN, Cr
  - urinalysis
  - peripheral blood smear: to detect microangiopathic hemolytic anemia
  - CXR: if SOB or chest pain
  - ECG, troponins, CK: if chest pain
  - CT head: if neurological findings or severe headache
  - toxicology screen if sympathomimetic overdose suspected
- management
  - in general, strategy is to gradually and progressively reduce BP in 24-48 h
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol)
  - if preeclampsia, immediately consult OB/GYN (see Obstetrics OB24)
  - establish arterial line; transfer to ICU for further reduction in BP if monitored setting
  - in case of ischemic stroke: do not rapidly reduce BP; maintain BP >150/100 for 5 d
  - in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - in case of excessive catecholamines: avoid β-blockers (except labetalol)
  - in case of ACS: address ischemia initially, then BP
Hypertensive Urgency
- definition: severely elevated BP (usually sBP >180, dBP >110) with no evidence of end-organ damage
- most commonly due to non-adherence with medications
- treatment: initiate/adjust antihypertensive therapy, monitor in ED (up to 6 h) and discharge with follow-up for 48-72 h
- goal: differentiate hypertensive emergencies from hypertensive urgencies

Table 22. Commonly Used Agents for the Treatment of Hypertensive Crisis

</tbody>
</table>

*Hypotension may occur with all of these agents

Acute Coronary Syndrome
- see Cardiology and Cardiac Surgery, C27
- definition: new onset of chest pain, or acute worsening of previous chest pain, or chest pain at rest with:
  - negative cardiac biomarkers and no ECG changes = Unstable angina (UA)
  - positive cardiac biomarkers (elevated troponin) and no ECG changes = NSTEMI
  - positive cardiac biomarkers (elevated troponin) and ST segment elevation on ECG = STEMI
- investigations
  - ECG STAT (as soon as ACS is suspected on history), troponin (2-6 h after symptom onset), CXR (to rule out other causes)
- management
  - stabilize: ABCs, oxygen, IV access, cardiac monitors, oximetry
  - ASA 162-325 mg chewed and swallowed
  - nitroglycerin 0.3 mg SL q5min x 3; IV only if persistent pain, CHF, or hypertensive
  - contraindications: hypotension, phosphodiesterase inhibitor use, right ventricular infarctions (⅓ of all inferior MIs)
anticoagulation: choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or prasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy
- early cardiology consultation for reperfusion therapy
- UA/NSTEMI: early coronary angiography recommended if high TIMI risk score
- STEMI: primary percutaneous coronary intervention (within 90 min) preferred; thrombolytics if unavailable within 120 min of medical contact, symptoms <12 h and no contraindications
- atorvastatin 80 mg to stabilize plaques
- β-blocker if no signs of CHF, hemodynamic compromise, bradycardia, or severe reactive airway disease
- ACEI initiated within 24 h

Sepsis
- see Infectious Diseases, ID21 and Respiratory, R34
- definitions
  - sepsis: life-threatening organ dysfunction caused by a dysregulated host response to infection
    - organ dysfunction defined as a change in baseline SOFA score ≥2 points
  - septic shock: profound circulatory, cellular, and metabolic abnormalities with greater risk of mortality than with sepsis alone
  - require vasopressors to maintain MAP ≥65 mmHg
  - serum lactate ≥2 mmol/L without hypovolemia
- management
  - early recognition of sepsis and investigations to locate source of infection
  - identify severe sepsis with lactate or evidence of tissue hypoperfusion
  - early “goal-directed” therapy: ensure adequate organ perfusion
  - treatment priorities:
    - ABCs, monitors, lines
    - aggressive fluid resuscitation; consider ventilatory and inotropic support
    - cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
    - source control - e.g. remove infected Foley or surgery for ischemic gut
    - monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial lactates

Stroke and TIA
- see Neurology, N48
- definitions
  - stroke: sudden loss of brain function due to ischemia (80%) or hemorrhage (20%) with persistence of symptoms >24 h or neuroimaging evidence
  - TIA: transient episode of neurologic dysfunction from focal ischemia without acute infarction typically lasting <1 h, but defined as <24 h
- clinical presentation

Table 23. Signs and Symptoms of Stroke

<table>
<thead>
<tr>
<th>Signs/ Symptoms</th>

| Upgoing | | Downgoing |
Investigations
- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- non-contrast CT head: look for hemorrhage, ischemia
- ECG ± echocardiogram: rule out AFib, acute MI as source of emboli
- other imaging: carotid Doppler, CTA, MRA as appropriate

Management
- ABCs: intubation with RSI if GCS ≤8, rapidly decreasing GCS, or inadequate airway protection reflexes
- thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV ± cardiac monitoring
  - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
  - BP control: only treat severe HTN (sBP >200, dBP >120, mean arterial BP >140) or HTN associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
  - glycemic control: keep fasting glucose <6.5% in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

Medications
- acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antiplatelet agents: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
- anticoagulation: DVT prophylaxis if immobile; treat AFib if present
- follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization

Dizziness and Vertigo
- distinguish four types of dizziness: vertigo (“room spinning”), lightheadedness (“disconnected from environment”), presyncope (“almost blacking out”), dysequilibrium (“unstable, off-balance”)
- broad differential and diverse management (see Family Medicine, FM25; see Otolaryngology, OT6)
  - consider medication adverse effects

Otalgia (see Otolaryngology, OT6)
- differential diagnosis
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis externa in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
  - observe for otorrhea, palpation of outer ear/mastoid, otoscope to see bulging erythematous tympanic membrane, perforation
  - C&S of ear canal discharge, if present
  - CT head ± suspicion of mastoiditis, malignant otitis externa
  - antibiotics/antifungals/antivirals for respective infections

Hearing Loss (see Otolaryngology, OT7)
- differentiate conductive vs. sensorineural hearing loss
- rule out sudden sensorineural hearing loss (SSNHL), a medical emergency requiring high dose steroids and urgent referral
- in elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise
- consider audiogram and referral or follow-up with family physician
Epistaxis
- see Otolaryngology, O26
- 90% of nosebleeds stem from the anterior nasal septum (at Kiesselbach’s plexus located in Little’s area)
- can be life-threatening

Etiology
- most commonly caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin®), or systemic disease (coagulopathies, HTN, etc.)

Investigations
- blood work: CBC, PT/PTT (as indicated)
- imaging: X-ray, CT as needed

Treatment
- aim is to localize bleeding and achieve hemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthetics/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or toxic shock syndrome
  - if bleeding is controlled with anterior pressure, cautery with silver nitrate can be performed if the site of bleeding is identified (one side of septum only because if both are cauterized this can lead to septal perforation)
  - if suspect posterior bleed or anterior packing does not provide hemostasis, consult ENT for posterior packing and further evaluation
  - posterior packing requires monitoring; can cause significant vagonal response and posterior bleeding source can lead to significant blood loss, therefore usually requires admission

Disposition
- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, topical ointments, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding, and most cases of posterior packing

Gynecologic/Urologic Emergencies

Vaginal Bleeding
- see Gynecology, GY10 and Obstetrics, OB13

Etiology
- pregnant patient
  - 1st/2nd trimester pregnancy: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  - 2nd/3rd trimester pregnancy: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp, passing of mucous plug
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
  - non-pregnant patients
  - Structural (PALM- polyps, adenomyosis, leiomyoma, malignancies/hyperplasia), non-structural (COEIN - coagulopathy ovulatory, endometrial, iatrogenic, and not yet diagnosed)

History
- characterize bleeding (frequency, duration, number of pads/tampons, cyclicity)
- pain, if present (OPQRSTU)
- menstrual history, sexual history, STI history, syncope/pre syncope
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

Complications of Nasal Packing
- Hypoxemia
- Toxic-shock syndrome
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removabale pack
Physical Exam
- ABC (especially noting postural BP/HR and mucous membrane)
- abdominal examination (peritoneal signs, tenderness, distension, mass)
- speculum examination (NOT IF 2nd/3rd trimester bleeding; perform only when placenta previa is ruled out with U/S)
  - look for active bleeding, trauma/anomaly, and cervical dilation
- bimanual examination (cervical tenderness, size of uterus, cervical length/dilation)
- sterile gloves and speculum if pregnant

Investigations
- β-hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative β-hCG, PTT, INR
- type and cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa, fetal demise, or retained products post-partum)

Management
- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
  - U/S indeterminate or β-hCG >1,000-2,000 IU: further workup and/or gynecology consult
  - abortions: if complete, discharge if stable; for all others, consult gynecology
- 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type and cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - if unstable admit to gynecology for IV hormonal therapy, possible D&C
  - non-structural abnormalities
    - tranexamic acid (Cyklokapron®) to stabilize clots
    - Provera® 10 mg PO OD x 10 d, warn patient of a withdrawal bleed
    - stable structural abnormalities (fibroids, polyps, endometrial thickening, adenomyosis), outpatient gynecology referral once stable

Disposition
- decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult gynecology for patients requiring admission
- if patient can be safely discharged, ensure follow-up with family physician or gynecologist
- instruct patient to return to ED for increased bleeding, presyncope

Nephrolithiasis (Renal Colic)

- see Urology, U17

Epidemiology and Risk Factors
- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

Clinical Features
- urinary obstruction \(\rightarrow\) upstream distention of ureter or collecting system \(\rightarrow\) severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- whirring, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

Differential Diagnosis of Renal Colic
- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- urogynecological: ectopic pregnancy, torsion, rupture of ovarian cyst, testicular torsion
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

Investigations
- screening
- CBC: elevated WBC in presence of fever suggests infection
- electrolytes, Cr, BUN to assess renal function
- U/A: R&M (WBCs, RBCs, crystals), C&S
- imaging
- non-contrast spiral CT is the study of choice
- abdominal U/S may demonstrate stone or hydronephrosis (consider in females of childbearing age)
- AXR will identify large radio-opaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlaid by bony structures; consider as an initial investigation in patients who have a history of radio-opaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine for stone analysis

Management
- analgesics: NSAIDs (usually ketorolac [Toradol\(^\text{\textregistered}\)], preferable over opioids), antiemetics, IV fluids
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- \(\alpha\)-blocker (e.g. tamsulosin) may be helpful to increase stone passage in select cases

Disposition
- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

Ophthalmologic Emergencies

- see Ophthalmology, OP5

History and Physical Exam
- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital X-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- visual acuity in both eyes, pupils, extraocular structures, fundoscopy, tonometry, slit lamp exam

Management of Ophthalmologic Foreign Body
- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

### Dermatologic Emergencies

#### Rash Characteristics

**A. Diffuse Rashes**

- **Staphylococcal Scalded Skin Syndrome (SSSS)**
  - caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
  - mostly occurs in children
  - prodrome: fever, irritability, malaise, and skin tenderness
  - sudden onset of diffuse erythema: skin is red, warm, and very tender
  - flaccid bullae that are difficult to see, then desquamate in large sheets
  - Nikolskay’s sign: gentle lateral stroking of skin causes epidermis to separate
- **Steven-Johnson Syndrome (SJS) and Toxic Epidermal Necrolysis (TEN)**
  - see Dermatology, D22
  - caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - usually occurs in adults
  - diffuse erythema followed by necrosis
  - severe mucous membrane blistering
  - entire epidermis desquamation
  - high mortality (>50%)
- **Toxic Shock Syndrome (TSS)**
  - see Infectious Diseases, ID23
  - caused by superantigen from *S. aureus* or GAS activating T cell and cytokines
  - patient often presents with onset of shock and multi organ failure, fever
  - diffuse erythematous macular rash
  - at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fascitis, gangrene)
Dermatologic Emergencies

- vesicobullous lesions
- Erythema Multiforme (EM)
  - see Dermatology, D29
  - immunologic reaction to herpes simplex
  - viral prodrome 1-14 d before rash
  - “target lesion”: central grey bulla or wheal surrounded by concentric rings of erythema and normal skin

B. Discrete Lesions
- pyoderma gangrenosum
  - often associated with immunocompromised patients (HIV, leukemia, or lymphoma) with Gram-negative sepsis
  - often occurs in arms, hands, feet, or perineal region
  - usually begins as painless macule/vesicle pustule/bulla on red/blue base sloughing, leaving a gangrenous ulcer
- disseminated gonococcal infection
  - see Dermatology, D22
  - fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - most commonly in gonococcus positive women during menstruation or pregnancy
  - skin lesions usually appear in extremities and resolve quickly (<7 d)
- meningococcemia
  - flu-like symptoms of headache, myalgia, N/V
  - petechial, macular, or maculopapular lesions with grey vesicular centres
  - usually a few millimeters in size, but may become confluent and hemorrhagic
  - usually appear in extremities, but may appear anywhere
  - look for signs of meningeal irritation: Brudzinski, Kernig, nuchal rigidity, jolt accentuation

History and Physical Exam
- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medication history
- vitals

Investigations
- immediate consultation if patient unstable
- CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

Management
- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococcemia
  - IV antibiotics
  - EM, SJS, and TEN
  - stop precipitating medication
  - fluids
  - symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir consider IVIG
  - TEN: debride necrotic tissue

Disposition
- most cases will require urgent care and hospitalization
- TEN: early transfer to burn centre improves outcome
Environmental Injuries

Heat Exhaustion and Heat Stroke

HEAT EXHAUSTION
- Clinical features relate to loss of circulating volume caused by exposure to heat stress
  - "water depletion": heat exhaustion occurs if lost fluid not adequately replaced
  - "salt depletion": heat exhaustion occurs when losses replaced with hypotonic fluid

HEAT STROKE
- Life-threatening emergency resulting from failure of normal compensatory heat shedding mechanisms
- Divided into classical and exertional subtypes
- If patient does not respond relatively quickly to cooling treatments, consider other possible etiologies
  of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, other infections)

<table>

</tbody>
</table>

Hypothermia and Cold Injuries

HYPOTHERMIA
- Hyperthermia is an increase in temperature by thermoregulatory failure, whereas fever is mediated by cytokine activity
- Predisposing factors: young persons who overexert themselves, older adults who cannot dissipate heat at rest (e.g. using anticholinergic drugs such as antihistamines or TCAs), and patients who are using anticholinergic or antiepileptic medications
- Treatment based on re-warming and supporting cardiopulmonary function
- Complications: coagulopathy, acidosis, ventricular dysrhythmias (VTib), asystole, volume and electrolyte depletion
- Labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN, Mg2+, Ca2+, amylase, coagulation profile
- Imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- Monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

<table>
<thead>
<tr>
<th>Table 29. Classification of Hypothermia</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
</tr>
<tr>
<td>Mild</td>
</tr>
<tr>
<td>Moderate</td>
</tr>
<tr>
<td>Severe</td>
</tr>
</tbody>
</table>

Re-warming Options
- Gentle fluid and electrolyte replacement in all (due to cold diuresis)
- Passive external re-warming
  - Suitable for most stable patients with core temperature >32.2°C
  - Involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
Environmental Injuries

- **active external re-warming**
  - involves use of warming blankets
  - beware of "afterdrop" phenomenon
  - safer when done in conjunction with active core re-warming

- **active core re-warming**
  - generally for patients with core temperature <32.2°C, and/or with cardiovascular instability
  - avoids "afterdrop" seen with AER alone
  - re-warm core by using
    - warmed humidified oxygen, IV fluids
    - peritoneal dialysis with warm fluids
    - gastric/colonic/pleural irrigation with warm fluids
    - external circulation (cardiopulmonary bypass machine) is most effective and fastest

Approach to Cardiac Arrest in the Hypothermic Patient
- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- if any pulse at all (even very slow) do NOT do CPR
  - if in VFib try to defibrillate up to maximum 3 shocks if core temperature <30°C
  - intubate if required, ventilate with warmed, humidified O₂
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures controversial; may try one dose
- focus of treatment is re-warming

**FROSTBITE**

**Classification**
- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
  - 1st degree
    - symptoms: initial paresthesia, pruritus
    - signs: erythema, edema, hyperemia, no blisters
  - 2nd degree
    - symptoms: numbness
    - signs: blistering (clear), erythema, edema
  - 3rd degree
    - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
    - signs: hemorrhagic blisters, skin necrosis, edema, no movement
  - 4th degree
    - extension into subcuticular, osseous, and muscle tissues

**Management**
- treat for hypothermia: O₂, IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in 40-42°C agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frost bite injury has high risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

**Burns**
- see Plastic Surgery, PL18

**Clinical Presentation/Physical Exam Findings**
- burn size
  - rule of nines; does not include 1st degree burns
- burn depth
  - superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  - superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  - deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation
  - full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensate, and charred or leathery
  - deep (4th degree): involvement of fat, muscle, even bone

**Management**
- remove noxious agent/stop burning process
- establish airway if needed (indicated with burns >40% BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)
Fluid boluses if unstable
- Parkland Formula: Ringer’s lactate 4 cc/kg/%BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
- urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics
- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, systemic antibiotics infrequently indicated
- tetanus prophylaxis if burn is deeper than superficial dermis

Disposition
- admit
  - 2nd degree burns >10% BSA, or any significant 3rd degree burns
  - 2nd degree burns on face, hands, feet, perineum, or across major joints
  - electrical, chemical burns, and inhalation injury
  - burn victims with underlying medical problems or immunosuppressed patients

Inhalation Injury

Etiology
- CO or cyanide poisoning
- direct thermal injury: limited to upper airway (above the vocal cords)
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

History and Physical Exam
- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin (unreliable, usually post-mortem finding)
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO2 normal but O2 saturation low suggests CO poisoning

Investigations
- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

Management
- CO poisoning: 100% O2 ± hyperbaric O2 (controversial)
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators, and mucolytics (N-acetylcysteine)

Bites

MAMMALIAN BITES
- see Plastic Surgery, PL11

History
- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, rabies risks HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, “fight bites”

Physical Exam
- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status

Investigations
- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation
- ultrasound may be helpful for identifying abscess formation as well as locating radiolucent foreign bodies in infected wounds

Initial Management
- wound cleansing and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
• culture wound if signs of infection (erythema, necrosis, or pus) obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound
• suturing
  • vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  • allow avascular structures (i.e. pretilial regions, hands, and feet) to heal by secondary intention
  • tetanus immunization if >10 yr or incomplete primary series

**Prophylactic Antibiotics**

• types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
• a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present (efficacy not proven)
• dog and cat bites (pathogens: *Pasteurella multocida, S. aureus, S. viridans*)
  • 10-50% of cat bites, 5% of dog bites become infected
• human bites (pathogens: *Eikenella corrodens, S. aureus, S. viridans, oral anaerobes*)
  • 1st line: amoxicillin + clavulanic acid
• rabies (see Infectious Diseases, ID20)
  • reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
  • post-exposure vaccine is effective; treatment depends on local prevalence

**INSECT BITES**

• bee stings
  • 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  • history and physical exam key to diagnosis; no lab test will confirm
  • investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
  • ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids, β-agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
  • West Nile virus (see Infectious Diseases, ID24)

**Near Drowning**

• most common in children <4 yr and teenagers
• causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
• must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
• complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

**Physical Exam**

  ABCs, vitals: watch closely for hypotension
  • respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
  • CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
  • H&N: assess for C-spine injuries
  • neurological: GCS or AVPU, pupils, focal deficits

**Investigations**

  • labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
  • imaging: CXR (pulmonary edema, pneumothorax) ± C-spine imaging
  • ECG

**Management**

  • ABCs, treat for trauma, shock, hypothermia
  • cardiac and O₂ monitors, IV access
  • intensive respiratory care
    • ventilator assistance if decreased respirations, pCO₂ >50 mmHg, or pO₂ <60 mmHg on maximum O₂
    • may require intubation for airway protection, ventilation, pulmonary toilet
    • high flow O₂/CPAP/BiPAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
  • dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
  • vomiting: very common, NG suction to avoid aspiration
  • convulsions: usually respond to O₂; if not, diazepam 5-10 mg IV slowly
  • bronchodilator: bronchodilators
  • bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (*Pseudomonas*)
  • always initiate CPR in drowning-induced cardiac arrest even if patient hypothermic; continue CPR until patient is fully rewarmed

**Disposition**

  • non-significant submersion: discharge after short observation
  • significant submersion (even if asymptomatic): long period of observation (24 h) as pulmonary edema may appear late
  • CNS symptoms or hypoxemia: admit
  • severe hypoxemia, decreased LOC: ICU
Toxicology

“ABCD₃EFG” of Toxicology

- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable

A  Airway (consider stabilizing the C-spine)
B  Breathing
C  Circulation
D1  Drugs
   - ACLS as necessary to resuscitate the patient
   - universal antidotes
D2  Draw bloods
D3  Decontamination (decrease absorption)
E  Expose (look for specific toxidromes)/Examine the patient
F  Full vitals, ECG monitor, Foley, X-rays
G  Give specific antidotes and treatments

- reassess
- call Poison Information Centre
- obtain corroborative history from family, bystanders

D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

**Dextrose (glucose)**
- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W
- children: 0.25 g/kg (2-4 mL/kg) IV of D25W

**Oxygen**
- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO₂ retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

**Naloxone** (central µ-receptor competitive antagonist, shorter t½ than naltrexone)
- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
    - draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2.5x IV dose)
      - 1st dose 0.4 mg
      - if no response, deliver second dose 0.6 mg
      - if still no response, deliver remaining 1 mg
  - child
    - 0.01 mg/kg initial bolus IV/OE/ETT
    - 0.1 mg/kg if no response and opioid still suspected to max of 10 mg
- maintenance dose
  - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
  - hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

**Thiamine** (Vitamin B1)
- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke’s encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke’s encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

---

**Toxicology**

**Universal Antidotes**

- DONT
  - Dextrose
  - Oxygen
  - Naloxone
  - Thiamine (must give BEFORE dextrose)

**Principles of Toxicology**

4 principles to consider with all ingestions:
- Resuscitation (ABCD₃EFG)
- Screening (toxidromes? clinical clues?)
- Decrease absorption of drug
- Increase elimination of drug

**Administration of naloxone can cause opioid withdrawal in chronic users:**

- Minor withdrawal may present as lacrimation, rhinorrhea, diaphoresis, yawning, piloerection, HTN, and tachycardia
- Severe withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

**Thiamine is deficient in the malnourished.**

Consider in patients with alcohol use disorder, anorexia, or malnutrition states
D2 – Draw Bloods

- **essential tests**
  - CBC, electrolytes, BUN/CR, glucose, INR/PTT, osmolality
  - ABGs, measure O₂ sat
  - ASA, acetaminophen, EtOH levels
- **potentially useful tests**
  - drug levels – this is NOT a serum drug screen
  - Ca²⁺, Mg²⁺, PO₄³⁻
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical presentation

**Serum Drug Levels**

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only)

**Table 30 Toxic Gaps (see Nephrology, NP16)**

<table>
<thead>
<tr>
<th>METABOLIC ACIDOSIS</th>
<th></th>

</tbody>
</table>
D3 – Decontamination and Enhanced Elimination

Ocular Decontamination
- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

Dermal Decontamination (Wear Protective Gear)
- remove clothing, brush off toxic agents, irrigate all external surfaces

Gastrointestinal Decontamination
- single dose activated charcoal
  - adsorption of drug/toxin to activated charcoal prevents availability
  - contraindications: caustics, small bowel obstruction, perforation
  - dose: 10 g/g drug ingested or 1g/kg body weight
  - odourless, tasteless, prepared as slurry with H2O
- whole bowel irrigation
  - 500 mL/h (child) to 2,000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
  - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
- indications
  - awake, alert, can be nursed upright OR intubated and airway protected
  - delayed release product
  - drug/toxin not bound to charcoal
  - drug packages (if any evidence of breakage emergency surgery)
  - recent toxin ingestion
- contraindications
  - evidence of ileus, perforation, or obstruction
  - surgical removal in extreme cases
  - indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
  - no evidence for the routine use of cathartics (i.e. ipecac)

Urine Alkalization
- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

Multidose Activated Charcoal
- may be used for: carbamazepine, phenobarbital, quinine, theophylline
- for toxins which undergo enterohepatic recirculation
- removes drug that has already been absorbed by drawing it back into GI tract
- various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic

Hemodialysis
- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  - removal of toxin will lead to clinical improvement
  - advantage is shown over other modes of therapy
  - predicted that drug or metabolite will have toxic effects
  - impairment of normal routes of elimination (cardiac, renal, or hepatic)
  - clinical deterioration despite maximal medical support
- useful for the following toxins
  - methanol
  - ethylene glycol
  - salicylates
  - lithium
  - phenobarbital
  - chloral hydrate (trichloroethanol)
  - others include theophylline, carbamazepine, valproate, methotrexate

E – Expose and Examine the Patient
- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, “tongue biting”, etc.), infection (meningismus), or chronic alcohol/drug abuse (track marks, nasal septum erosion)
- mental status

* Call local Poison Information Centre for specific doses and treatment recommendations
Alcohol Related Emergencies

- see Psychiatry PS23

**Acute Intoxication**
- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants/street drugs, toxic alcohols
  - may also contribute to respiratory/cardiac depression
- hypoglycemia (screen with bedside glucometer)
- hepatic encephalopathy: confusion, altered LOC, coma
  - precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
- Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
- post-ictal state, basilar stroke

**Withdrawal**
- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1h until calm
  - frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 100 mg IM/IV then 50-100 mg/d
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with DT or multiple seizures

**Table 35. Alcohol Withdrawal Signs**

**Cardiovascular Complications**
- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

**Metabolic Abnormalities**
- alcoholic ketoacidosis
  - AG metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
  - generally resolves in 12-24 h
- other alcohols
  - ethylene glycol CNS, CVS, renal findings
  - methanol
    - early: lethargy, confusion
    - late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
  - EtOH co-ingestion is protective
• treatment
  - urgent hemodialysis required
  - fomepizole 15 mg/kg IV bolus OR EtOH 10% IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
  - consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites

• other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

**Gastrointestinal Abnormalities**
• gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
• pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
• hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
• peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: \(E\ coli\), Klebsiella, Streptococcus)
• GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy

**Disposition**
• before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
• offer social services to find shelter or detox program
• ensure patient can obtain any medications prescribed and can complete any necessary follow-up

---

**Approach to the Overdose Patient**

**History**
• age, weight, underlying medical problems, medications
• substance, route, and quantity
• time and symptoms since exposure determines prognosis and need for decontamination
• route
• intention, suicidality

**Physical Exam**
• focus on: ABCs, LOC/GCS, vitals, pupils

**Disposition from the Emergency Department**
• methanol, ethylene glycol
  - delayed onset, admit and watch clinical and biochemical markers
• TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored (ICU) bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
• hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
• ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 levels going down before discharge (3 levels minimum)
• oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h

**Psychiatric Consultation**
• once patient medically cleared, arrange psychiatric intervention if required
• beware – suicidal ideation may not be expressed
Psychiatric Emergencies

Approach to Common Psychiatric Presentations

• see Psychiatry, PS4
• before seeing patient, ensure your own safety; have security/police available if necessary

History

• safety
  • assess suicidality: suicidal ideation (SI), intent, plan, lethal means, and past attempts
  • assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  • driving and children
  • command hallucinations
  • identify current stressors and coping strategies
  • mood symptoms: manic, depressive
  • anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
  • psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
  • substance use history: most recent use, amount, previous withdrawal reactions
  • past psychiatric history, medications, adherence with medications
  • medical history: obtain collateral if available

Physical Exam

• complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
• mental status exam: general appearance, behaviour, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

Investigations

• investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
• as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, biliubin, serum Cr, BUN, and osmolality
• blood levels of psychiatric medications
• CT head if suspect neurological etiology
  LP if indicated

Acute Psychosis

Differential Diagnosis

• primary psychotic disorder (e.g. schizophrenia)
• secondary to medical condition (e.g. delirium)
• drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
• infectious (CNS)
• metabolic (hypoglycemic, hepatic, renal, thyroid)
• structural (hemorrhage, neoplasm)

Management

• violence prevention
  • remain calm, empathic, and reassuring
  • ensure safety of staff and patients, have extra staff and/or security on hand
  • patients demonstrating escalating agitation or overt violent behaviour may require physical restraint and/or chemical tranquilization
  • treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  • benzodiazepines: lorazepam 2 mg PO/IM/SL
  • antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
• treat underlying medical condition
• psychiatry or Crisis Intervention Team consult

Key Functions of Emergency Psychiatric Assessment

• Is the patient medically stable?
• Rule out medical cause
• Is psychiatric consult needed?
• Are there safety issues (SI, HI)?
• Is patient certifiable? (must demonstrate risk [present/past test] and apparent mental illness [future test])

Suicidal Patient

Epidemiology
- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr

Management
- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts
- admit if there is evidence of active intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

Respiratory Distress

- see Pediatrics, P79

History and Physical Exam
- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
- see Pediatrics, P3 for age specific vital signs
- pulse paradoxus
- wheezing, grunting, vomiting

NOTE
- Oral exam
- Oral exam
- No oral exam, consult ENT

¹Now rare with Hb vaccine in common use
Management

- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - dexamethasone x 1 dose
  - if moderate-severe, add nebulized epinephrine (racemic has limited availability)
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
  - humidified O₂ should not be given (no evidence for efficacy)
- bacterial tracheitis
  - airway maintenance - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
  - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesiology, ENT call – intubate
  - then IV fluids, antibiotics, blood cultures
- asthma
  - supplemental O₂ if saturation <90% or PaO₂ <60%
  - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg x3 by mask q20min
  - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.6 mg/kg, 2 doses 24 h apart)
  - if severe, add 250-500 µg ipratropium (Atrovent®) to first 3 doses salbutamol if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO₄
  - IV ß₂-agonists if critically ill and not responding to above

FEBRILE INFANT and FEBRILE SEIZURES

FEBRILE INFANT
- see Pediatrics, P46
- for fever >38°C without obvious focus
  - <28 d
    - admit
    - full septic workup (CBC and differential, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
    - treat empirically with broad spectrum IV antibiotics
  - 28-90 d
    - as above unless infant meets Rochester criteria, partial septic workup (CBC and differential, blood C&S, urine C&S, CXR if indicated)
  - >90 d
    - toxic: admit, treat, full septic workup
    - non-toxic and no focus: investigate as indicated by history and physical

FEBRILE SEIZURES
- see Pediatrics, P77

Etiology

- children aged 6 mo-6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well-looking after seizure

Investigations and Management

- if it is a febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
  - ± EEG (especially if first seizure), head U/S (if fontanelle open)

</table>

Red Flags for Abdominal Pain
- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis
- Trauma or suspected trauma patient <1 yr of age with a large, boggy scalp hematoma requires U/S or CT

Common Infections

- see Pediatrics, P50

</table>
Child Abuse and Neglect

- see Pediatrics, P14
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken Baby Syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures age <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

<td>↑ TG, ↑ VLDL</td>
<td>Possible premature CAD. Develop syndrome of obesity, hypertriglyceridemia, hyperinsulinemia, and hyperuricemia in early adulthood.</td>
<td>Decrease dietary simple carbohydrates and fat intake. Abstain from EtOH. Fibre x or niacin.</td>
</tr>
</tbody>
</table>
SECONDARY HYPERTRIGLYCERIDEMIA

Etiology
- endocrine: obesity/metabolic syndrome, hypothyroidism (more for high LDL, not TG), acromegaly, Cushing's syndrome, DM
- renal: chronic renal failure, polyclonal and monoclonal hypergammaglobulinemia
- hepatic: chronic liver disease, hepatitis, glycogen storage disease
- drugs: alcohol, corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
- other: pregnancy

Hypercholesterolemia

<td>In many cases, over-population of VLDL and associated ↑ LDL 2+ to excess hepatic synthesis of apolipoprotein B Autosomal dominant</td>
<td>↑ TC + G ↑ VLDL ↑ LDL</td>
<td>Xanthelasma CAD and other vascular disease</td>
<td>Weight reduction Decrease simple carbohydrates, fat, cholesterol, and EtOH in diet Fibrates, statins, ezetimibe, PCSK9 inhibitor</td>
</tr>
</tbody>
</table>

SECONDARY HYPERCHOLESTEROLEMIA

Etiology
- endocrine: hypothyroidism
- renal: nephrotic syndrome
- immunologic: monoclonal gammopathy
- hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)
- nutritional: diet, anorexia nervosa
- drugs: cyclosporin, anabolic steroids, carbamazepine

Low High-Density Lipoprotein

PRIMARY CAUSES

Table 4. Primary Low HDL Cholesterol Levels

<table>

<tr>
<td>Tangier Disease</td>
<td>Autosomal recessive inheritance of mutations in the ABCA1 gene Impaired HDL-mediated cholesterol efflux from macrophages and impaired intracellular lipid trafficking</td>
<td>Mild hypertriglyceridemia Neuropathy Enlarged, orange-coloured tonsils Premature atherosclerosis Splenomegaly Hepatomegaly Corneal clouding Type 2 DM</td>
<td>Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present</td>
</tr>
</tbody>
</table>
SECONDARY CAUSES

Etiology
- endocrine: obesity/metabolic syndrome, DM
- drugs: β-blockers, benzodiazepines, anabolic steroids
- other: acute infections, inflammatory conditions

Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3–9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women
- treatment of hypertriglyceridemia has not been shown to reduce CAD risk

Screening
- screen men >40 yr, women >50 yr or post-menopausal
- if following risk factors present, screen at any age:
  - DM
  - current cigarette smoking or COPD
  - HTN (sBP >140, dBP >90)
  - obesity (BMI >27 kg/m²)
  - family history of premature CAD
  - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  - evidence of atherosclerosis
  - inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
  - HIV infection on highly active antiretroviral therapy (HAART)
  - chronic kidney disease (estimated GFR <60 mL/min/1.73 m²)
  - erectile dysfunction
  - screen children with a family history of hypercholesterolemia or chylomicronemia

Factors Affecting Risk Assessment
- metabolic syndrome
- apolipoprotein B (apo B)
  - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of apo B
  - serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
- C-reactive protein (hs-CRP) levels
  - highly sensitive acute phase reactant
  - may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

Treatment of Dyslipidemias

Approach to Treatment
For clinical guidelines see Can J Cardiol 2016;32:1263-1282.
- consider treatment for patients with statin-induced conditions (listed below); risk assessment is not required
  - for primary prevention:
    - estimate 10 yr risk of CAD using Framingham Risk Score (FRS) model
    - establish treatment targets
    - low FRS does not require statin treatment

Adapted from 2016 CCS Dyslipidemia guidelines
Disorders of Glucose Metabolism

Overview of Glucose Regulation

Figure 3. Blood glucose regulation

Pre-Diabetes (Impaired Glucose Tolerance/Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance
- increased risk of developing macrovascular complications (IGT >IFG)
- lifestyle modifications decrease progression to DM by 58%

Diagnostic Criteria (CDA Guidelines)

- impaired fasting glucose (IFG): fasting plasma glucose (FPG) 6 1 6.9 mmol/L
- impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 7.8-11.0 mmol/L
- HbA1c: 6.0-6.4%

Common Medications

- HMG-CoA reductase inhibitors, ezetimibe, bile acid sequestrants, niacin (see Common Medications, E49)

Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein (Jupiter Study)

**NEJM 2008;359(21):2195-207**

**Study:** Randomized Control Trial

**Intervention:** Statin Therapy

**Results:** Rosuvastatin reduced LDL cholesterol levels by 50% and high-sensitivity C-reactive protein levels by 37%. The rates of the primary end point were 0.77 and 1.36 per 100 person-years of follow-up in the rosuvastatin and placebo groups, respectively (hazard ratio for rosuvastatin, 0.56; 95% confidence interval [CI], 0.46-0.69; P < 0.0001), with corresponding rates of 0.17 and 0.37 for myocardial infarction (hazard ratio, 0.49; 95% CI, 0.40-0.58; P < 0.0001), 0.45 and 0.65 for stroke (hazard ratio, 0.52; 95% CI, 0.43-0.64; P < 0.0001), and 1.00 and 1.25 for death from any cause (hazard ratio, 0.89; 95% CI, 0.74-1.07; P = 0.19).

**Conclusion:** Statins reduce the incidence of major cardiovascular events even in healthy people without hyperlipidemia but with elevated C-reactive protein.

Three Year Efficacy of Complex Insulin Regimens in Type 2 DM: A 3Y Trial

**NEJM 2009;361:1736-1747**

**Study:** Randomized unblinded trial with 3 yr of follow-up.

**Population:** 718 patients with type 2 DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.

**Intervention:** Three-daily prandial insulin aspart, versus twice-daily biphasic insulin aspart, versus once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regimen specific to each arm if there was persistent hypoglycemia.

**Primary Outcome:** Three yr hemoglobin HbA1c.

**Results:** Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 11.3% basal regimens (p = 0.04). There were no significant differences in median HbA1c levels between all three arms from yr 1-3. A smaller proportion of patients reached HbA1c <6.5% or <7.0% in the biphasic arm. The basal arm had least weight gain and least weight circumference increase, but highest rate of secondary insulin requirement. The basal arm had lowest severe hypoglycemic events per patient yr, while the biphasic had the most serious adverse effects.

**Conclusion:** Basal insulin regime provides the best glycemic control over a 3 yr study, with better HbA1c control, fewer hypoglycemic events, and less weight gain.
Diabetes Mellitus

Definition
- syndrome of disordered metabolism and inappropriate hyperglycemia secondary to an absolute/relative deficiency of insulin, or a reduction in biological effectiveness of insulin, or both

Diagnostic Criteria (CDA Guidelines)
- any one of the following is diagnostic
  - FPG ≥7.0 mmol/L (fasting = no caloric intake for at least 8 h) OR
  - 2 h 75 g OGTT ≥11.1 mmol/L OR
  - random PG ≥11.1 mmol/L OR
  - HbA1c ≥6.5% (not for diagnosis of suspected Type 1 DM, children, adolescents, or pregnant women)
- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision), a confirmatory test is not required
- in the absence of hyperglycemic symptoms, a repeat confirmatory test is required to make the diagnosis of diabetes

Etiology and Pathophysiology

Table 7. Etiologic Classification of Diabetes Mellitus

| I. Type 1 DM (immune-mediated β cell destruction, usually leading to absolute insulin deficiency) |
| II. Type 2 DM (ranges from predominantly insulin resistance with relative insulin deficiency to a predominantly insulin secretory defect with insulin resistance 2º to β cell dysfunction) |
| III. Other Specific Causes of DM |
  | a. Genetic defects of β cell function (e.g. MODY – Maturity-Onset Diabetes of the Young) or insulin action |
  | b. Diseases of the exocrine pancreas: |
  | Pancreatitis, pancreactectomy, neoplasia, cystic fibrosis, hemochromatosis ("bronze diabetes") |
  | c. Endocrinopathies: |
  | Acromegaly, Cushing’s syndrome, glucagonoma, pheochromocytoma, hyperthyroidism |
  | d. Drug-induced: |
  | Glucocorticoids, thyroid hormone, β-adrenergic agonists, thiazides, phenytoin, clozapine |
  | e. Infections: |
  | Congenital rubella, CMV, coxsackie |
  | f. Genetic syndromes associated with DM: |
  | Down’s syndrome, Klinefelter’s syndrome, Turner’s syndrome |

IV. Gestational Diabetes Mellitus (see Obstetrics, OB26)

Effects of Intensive Treatment of Type 1 DM on the Development and Progression of Long-Term Complications: The DCCT Study

- Study: Multicentre RCT, with 6.5 yr of mean follow-up
- Patients: 1,441 patients (aged 13-39 yr) with type 1 DM with no cardiovascular history or severe diabetic complications
- Intervention: Intensive therapy (3 or more daily insulin injections or treatment with an insulin pump with dose adjustments as needed, BG monitoring minimum q-d, monthly visits strict BG targets) vs. Conventional therapy (1 or 2 insulin injections per day with no dose adjustments, daily BG monitoring visits q-3 months).
- Outcomes: Primary outcome was development or progression of retinopathy. Secondary outcomes were development or progression of renal, neurological, cardiovascular, and neuropathological outcomes
- Results: Intensive treatment of Type 1 DM significantly reduced the risk for the development and progression of retinopathy in the primary- and secondary-intervention cohorts, respectively. Intensive therapy also reduced the occurrence of microalbuminuria, albuminuria, and clinical neophopathy. The chief adverse event associated with intensive therapy was an increase in the occurrence of severe hypoglycemia.
- Conclusions: Intensive treatment of Type 1 DM significantly reduces the development and progression of diabetic retinopathy, nephropathy, and neuropathy in patients with Type 1 DM.

Blood Glucose Control in Type 2 DM – UKPDS 33

- Study: RCT (mean follow-up 10 yr)
- Patients: 3,867 patients with newly diagnosed type 2 DM (mean age 53 yr, 61% men, 81% white, mean fasting plasma glucose [FPG] 6.1-15.0 mmol/L)
- Exclusions: included severe cardiovascular disease, renal disease, retinopathy, and others.
- Intervention: Intensive treatment with a sulfonylurea (all patients) or a sulfonylurea and metformin (target FPG ≤6.1 mmol/L without hyperglycemic symptoms). Intensive treatment with metformin alone (target FPG ≤7.0 mmol/L) vs. conventional treatment with diet alone (target FPG <15 mmol/L).
- Main Outcomes: DM-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia); DM-related death, and all-cause mortality.
- Results: Patients allocated to intensive treatment had lower median HbA1c levels (p<0.001).

<table>

<td>0.44 (0.04)</td>
</tr>
</tbody>
</table>

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.
- Conclusion: Intensive blood glucose control reduces microvascular, but not macrovascular complications in type 2 DM.
Glycemic Targets
- HbA1c reflects glycemic control over 3 mo and is a measure of patient’s long-term glycemic control
- therapy in most individuals with type 1 or type 2 DM (especially younger patients) should be targeted to achieve a HbA1c ≤7.0% in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, HbA1c <6.5%, may be targeted in type 2 DM in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- less stringent HbA1c targets (7.1-8.5%) may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to attain HbA1c <7.0% despite intensified basal and bolus insulin therapy
- there may be harm associated with strategy to target HbA1c <6.0% (see ACCORD trial, E9)

Diet
- daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy
- intake of saturated fats <7% and polyunsaturated fats <10% of total calories each
- limit sodium, alcohol, and caffeine intake
- type 1: carbohydrate counting is used to titrate insulin regimen
- type 2: weight reduction
Lifestyle
- regular physical exercise to improve insulin sensitivity, lower lipid concentrations and control blood pressure
- smoking cessation

Medical Treatment: Non-insulin Antihyperglycemic Agents (Type 2 DM)
- initiate non-insulin antihyperglycemic therapy within 2-3 mo if lifestyle management does not result in glycemic control
- if initial HbA1c >8.5% at the time of diagnosis, initiate pharmacologic therapy with metformin immediately and consider combination of therapies or insulin immediately
- continue to add additional pharmacologic therapy in a timely fashion to achieve target HbA1C within 3-6 mo of diagnosis
- see Common Medications, E49 for details on antihyperglycemic agents

Medical Treatment: Insulin (Figure 5)
- used for type 1 DM at onset, may be used in type 2 DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin glulisine, Insulin lispro)
- basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, glargine)
- premixed insulins (combination of basal and bolus insulins) available but not used regularly
- estimated total daily insulin requirement: 0.5-0.7 units/kg (often start with 0.3-0.5 units/kg/d)

Effects of Intensive Glucose Lowering in Type 2 DM: The ACCORD Trial

NEWS: Reducing glycemia in type 2 diabetes (Diabetes Care 2010;33: 1777-1783)

Study: Multicentre RCT.

Patients: 10,251 patients (mean age 62.2) with type 2 DM and cardiovascular risk factors.

Intervention: Intensive therapy targeting a HbA1c level of less than 6.0% or standard therapy targeting 7.0-7.9%.

Outcomes: First occurrence of nonfatal MI, nonfatal stroke, or death from CV causes.

Results: The intensive therapy arm was stopped early (3.5 yr vs. 5.6 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV mortality, nonfatal MI, and CHF in the intensive therapy group. There were increased rates of all hypoglycemic events, any hypoglycemic serious adverse events, fluid retention, and weight gain >10 kg. The annualized incidence of hypoglycemia was 3.4% (95% CI 3.3-3.5) versus 2.5% (95% CI 2.3-2.7) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 2.2%, p=0.02), especially urinary tract infections (5.2% vs. 2.4%, p<0.01) and hyperkalemia (0.4% vs. 0.2%, p=0.01). There was no significant difference in primary outcomes in the two study arms, or all cause mortality. There was a significant reduction in any stroke (2.12%/yr vs. 0.54%/yr, p=0.01), and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, p=0.03) in the intensive therapy arm.

Conclusions: Intensive BP lowering to less than 120 mmHg (80 mmHg for diabetics) versus standard therapy was an increased incidence of elevated ALT (>3x upper limit) and ACE drug use in the standard therapy group.

Additional therapy was required to control blood pressure. The intensive therapy arm was stopped early (3.5 yr vs. 5.6 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV mortality, nonfatal MI, and CHF in the intensive therapy group. There were increased rates of all hypoglycemic events, any hypoglycemic serious adverse events, fluid retention, and weight gain >10 kg. The annualized incidence of hypoglycemia was 3.4% (95% CI 3.3-3.5) versus 2.5% (95% CI 2.3-2.7) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 2.2%, p=0.02), especially urinary tract infections (5.2% vs. 2.4%, p<0.01) and hyperkalemia (0.4% vs. 0.2%, p=0.01). There was no significant difference in primary outcomes in the two study arms, or all cause mortality. There was a significant reduction in any stroke (2.12%/yr vs. 0.54%/yr, p=0.01), and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, p=0.03) in the intensive therapy arm.

Conclusions: Intensive BP lowering to less than 120 mmHg (80 mmHg for diabetics) versus standard therapy was an increased incidence of elevated ALT (>3x upper limit) and ACE drug use in the standard therapy group.
Insulin Regimens

<td>2/3 dose is given as pre-mixed insulin before breakfast, lunch, and dinner</td>
</tr>
<tr>
<td></td>
<td>Continue metformin but discontinue secretagogue</td>
</tr>
</tbody>
</table>

*Bolus insulin: Aspart, Glulisine, Lispro; *Basal insulin: Gargine, Detemir NPH *Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, Humalog Mix25, Humalog Mix50

Variable Insulin Dose Schedule (“Supplemental/Correction Scale”)
- for patients on Basal-Bolus regimen: patient takes usual doses of basal insulin but varies doses of bolus insulin based on BG reading at time of dose
- use baseline bolus insulin dose when within BG target range; add or subtract units when above or below target
- when used in hospital (including perioperative management of DM), patient should also receive basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia construction of a supplemental sliding scale for a patient on anti-hyperglycemics
  - Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD)
    - BG <4: call MD and give 15 g carbohydrates
    - BG between 4 to 8: no additional insulin
    - BG between 8 to (8 + CF): give one additional unit
    - BG between (8 + CF) to (8 + 2CF): give two additional units
    - BG between (8 + 2CF) to (8 + 3CF): give three additional units

Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)
- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected
- coverage available for insulin pumps for individuals with Type 1 DM varies by province
### Acute Complications

#### Table 12. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States

<table>
<thead>
<tr>
<th>Pathophysiology</th>
<th>Diabetic Ketoacidosis (DKA)</th>
<th>Hyperosmolar Hyperglycemic State (HHS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Usually occurs in type 1 DM</td>
<td>• Occurs in type 2 DM</td>
<td></td>
</tr>
<tr>
<td>• Insulin deficiency with ↑ catabolism</td>
<td>• Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns</td>
<td></td>
</tr>
<tr>
<td>• Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise)</td>
<td>• Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglycemia-cagonemia and hepatic glucose production</td>
<td></td>
</tr>
<tr>
<td>• Unopposed hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ Na⁺ (water shift to ECF causing pseudohyponatremia)</td>
<td>• Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis</td>
<td></td>
</tr>
<tr>
<td>• Fat mobilization → ↑ FFA → ketoadiposis</td>
<td>• Characterized by hyperglycemia, hyperosmolality and dehydration without ketosis</td>
<td></td>
</tr>
<tr>
<td>• Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria</td>
<td>• More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly</td>
<td></td>
</tr>
<tr>
<td>• Total body K⁺ depletion but serum K⁺ may be normal or elevated, 2° to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality</td>
<td>• Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma</td>
<td></td>
</tr>
<tr>
<td>• Total body PO₄³⁻ depletion</td>
<td>• Total body PO₄³⁻ depletion</td>
<td></td>
</tr>
</tbody>
</table>

#### Clinical Features

| • Polypnea, polydipsia, polyphagia with marked fatigue, N/V | • Onset is insidious → preceded by weakness, polyuria, polydipsia |  |
| • Dehydration (orthostatic changes) | • History of decreased fluid intake |  |
| • LOC may be ↓ with ketoacidosis or with high serum osmolality (osm >330 mmol/L) | • History of ingesting large amounts of glucose containing fluids |  |
| • Abdominal pain | • Dehydration (orthostatic changes) |  |
| • Fruity smelling breath | • ↓ LOC → lethargy, confusion, coma due to high serum osmolality |  |
| • Kussmaul’s respiration | • Kussmaul’s respiration is absent unless the underlying precipitant has also caused a metabolic acidosis |  |

#### Serum

| • ↑ BG (typically 11-55 mmol/L, ↓ Na⁺ (2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na⁺ by 3 mmol/L) | • ↑ BG (typically 44.4-133.2 mmol/L) |  |
| • Normal or ↑ K⁺, ↓ HCO₃⁻, ↑ BUN, ↑ Cr, ketonemia, ↓ PO₄³⁻ | • In mild dehydration, may have hyponatremia (spurious 2° to hyperglycemia → for every ↑ in BG by 10 mmol/L, there is a ↓ in Na⁺ by 3 mmol/L) |  |
| • ↑ osmolality | • if dehydration progresses, may get hypernatremia |  |

#### Urine

| • Metabolic acidosis with ↑ AG, possible 2° respiratory alkalosis | • Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI) |  |
| • If severe vomiting/dehydration there may be a metabolic alkalosis | • Glycosuria |  |

#### Treatment

| • ABCs are first priority | • Same resuscitation and emergency measures as DKA |  |
| • Monitor degree of ketoacidosis with AG, not BG or serum ketone level | • Rehydration |  |
| • Rehydration | — IV fluids: 1 L/h NS initially |  |
| — 1 L/h NS in first 2 h | — evaluate corrected serum Na⁺ |  |
| — after 1st 2 L, 300-400 mL/h NS. Switch to 0.45% NaCl once euvolemic (continue NS if corrected sodium is falling faster than 3 mmol/kg/h) | — if corrected serum Na⁺ high or normal, switch to 0.45% NaCl (4.14 mL/kg/h) |  |
| — once BG reaches 13.9 mmol/L then switch to DSW to maintain BG in the range of 12-14 mmol/L | — if corrected serum Na⁺ low, maintain NS (4.14 mL/kg/h) |  |
| • Insulin therapy | — when serum BG reaches 13.9 mmol/L switch to DSW |  |
| — critical to resolve acidosis, not hyperglycemia | |  |
| — do not use with hypokalemia (see below), until serum K⁺ is corrected to >3.3 mmol/L | • K⁺ replacement |  |
| — use only regular insulin (R) | — less severe K⁺ depletion compared to DKA |  |
| — maintain on 0.1 U/kg/h insulin R infusion | — if serum K⁺ <3.3 mmol/L, hold insulin and give 40 mEq/L K⁺ replacement |  |
| — check serum glucose hourly | — if K⁺ is 3.3-5.0, give KCl 20-30 mEq/L IV fluid |  |
| • K⁺ replacement | — if serum K⁺ ≥5.5 mmol/L check K⁺ every 2 h |  |
| — with insulin administration, hypokalemia may develop | • Search for precipitating event |  |
| — if serum K⁺ <3.3 mmol/L, hold insulin and give 40 mEq/L K⁺ replacement | • Insulin therapy |  |
| — when K⁺ 3.5-5.0 mmol/L add KCl 20-40 mEq/L IV fluid to keep K⁺ in the range of 3.5-5 mEq/L | — use only regular insulin (R) |  |
| • HCO₃⁻ | — initially load 0.1 U/kg body weight insulin R bolus |  |
| — if pH <7.0 or if hypotension, arrhythmia, or coma is present with a pH of <7.1 give HCO₃⁻ in 0.45% NaCl | — maintenance 0.1 U/kg/h insulin R infusion or IM |  |
| — do not give if pH >7.1 (risk of metabolic alkalosis) | — check serum glucose hourly |  |
| — can give in case of life-threatening hyperkalemia | • K⁺ depletion in general lower insulin requirement compared to DKA |  |
| • ± mannitol (for cerebral edema) | • Overall mortality approaches 50% primarily because of the older patient population and underlying etiology/precipitant |  |

#### Prognosis

| • 2.5% mortality in developed countries | • Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children) |  |
Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see Cardiology and Cardiac Surgery, C32)
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in type 2 DM
  - most patients with DM are considered “high risk” under the risk stratification for CAD (see Dyslipidemias, E3)
- ischemic stroke (see Neurology, N50)
  - risk of stroke is approximately 2.5x higher in those with DM
  - level of glycemia is both a risk factor for stroke and a predictor of a poor outcome in patients who suffer a stroke
  - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see Vascular Surgery, VS2)
  - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- treatment
  - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight low density lipoprotein (LDL) cholesterol control (LDL ≤2.0 mmol/L)
  - ACEI or angiotensin receptor blocker in high-risk patients
  - smoking cessation
  - for adults with CVD who do not meet glycemic targets, recommended to add anti-hyperglycemic agent with demonstrated cardiovascular benefit (empagliflozin or liraglutide) to reduce the risk of major cardiovascular events

Microvascular Complications

DIABETIC RETINOPATHY (see Ophthalmology, OP33 for a more detailed description)

Epidemiology
- type 1 DM: 25% affected at 5 yr, 100% at 20 yr
- type 2 DM: 25% affected at diagnosis, 60% at 20 yr
- leading cause of blindness in North America between the ages of 20-74
- most important factor is disease duration

Clinical Features
- nonproliferative
- preproliferative
- proliferative

Treatment and Prevention
- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- ophthalmological treatments available – see Ophthalmology, OP33 for more details
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of type 2 DM; 5 yr after diagnosis of type 1 DM)
- interval for follow-up should be tailored to severity of retinopathy

DIABETIC NEPHROPATHY (see Nephrology, NP31 for a more detailed description)

Epidemiology
- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with type 1 DM (after 5-10 yr) and 4-20% with type 2 DM have progressive nephropathy

Screening
- serum creatinine
- random urine test for albumin to creatinine ratio (ACR) plus urine dipstick test for all type 2 DM patients at diagnosis, then annually, and for postpubertal type 1 DM patients with ≥5 yr duration of DM

Treatment and Prevention
- appropriate glycemic control
- appropriate blood pressure control (<130/80 mmHg)
- use either ACEI or ARB (often used first line for their CVD protection)
- limit use of nephrotoxic drugs and dyes
DIABETIC NEUROPATHY

Epidemiology
• approximately 50% of patients within 10 yr of onset of type 1 DM and type 2 DM

Pathophysiology
• can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
• mechanism poorly understood
• acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
• the more common motor and sensory neuropathies are thought to be related to metabolic or osmotic toxicity secondary to increased sorbitol and/or decreased myoinositol (possible mechanisms include accumulation of advanced glycation end products [AGE], oxidative stress, protein kinase C, nerve growth factor deficiency)

Screening
• 128 Hz tuning fork or 10 g monofilament at diagnosis and annually in people with type 2 DM and after 5 yr duration of type 1 DM

Clinical Features

<table>
<thead>
<tr>
<th>Peripheral Sensory Neuropathy</th>
<th>Motor Neuropathy</th>
<th>Autonomic Neuropathy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation</td>
<td>Less common than sensory neuropathy</td>
<td>Postural hypotension tachycardia, decreased cardiovascular response to Valsalva maneuver</td>

</tr>
</tbody>
</table>

Treatment and Management
• tight glycemic control
• for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin) and capsaicin
• foot care education
• Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
• treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
• medical, mechanical, and surgical treatment for erectile dysfunction (see Urology, U30)

Other Complications

Dermatologic
• diabetic dermopathy: atrophic brown spots commonly in pretibial region known as “skin spots”, secondary to increased glycosylation of tissue proteins or vasculopathy
• eruptive xanthomas secondary to increased triglycerides
• necrobiosis lipoidica diabeticorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

Bone and Joint Disease
• juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
• Dupuytren’s contracture
• bone demineralization: bone density 10-20% below normal
• adhesive capsulitis (“frozen shoulder”)

Cataracts
• subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

Infections
• see Infectious Diseases, ID14

Toronto Notes 2018

Back to Top
Hypoglycemia (BG <4.0 mmol/L or 72 mg/dL)

Etiology and Pathophysiology
- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish fasting from post-prandial hypoglycemia as each invokes separate differential diagnoses

Table 14. Common Causes of Hypoglycemia

Clinical Features
- Whipple's triad
  1. serum glucose <2.5 mmol/L in males and <2.2 mmol/L in females
  2. neuroglycopenic symptoms
  3. rapid relief provided by administration of glucose
- adrenergic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia
- neuroglycopenic symptoms (caused by decreased activity of CNS)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

Investigations
- electrolytes, creatinine, LFTs, drugs/toxins, cortisol
- if concerned about possible insulinoma
  - blood work to be drawn when patient is hypoglycemic (e.g. during hospitalized 72-h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

Treatment
for fasting hypoglycemia, must treat underlying cause
- for post-prandial (reactive) hypoglycemia, frequent small feeds
- see Emergency Medicine, ER35
treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV or 1 mg glucagon SC (if no IV available)
  - may need ongoing glucose infusion once BG >5 mmol/L

Metabolic Syndrome
- several definitions exist
- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

Obesity
- see Family Medicine, FM7
Pituitary Gland

Pituitary Hormones

Figure 7. Hypothalamic-pituitary hormonal axes
CRH = corticotropin-releasing hormone; GHRH = growth hormone-releasing hormone; GnRH = gonadotropin-releasing hormone; PRH = prolactin-releasing hormone; TRH = thyrotropin-releasing hormone

Hypothalamic Control of Pituitary
- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except prolactin which is primarily under inhibitory control by dopamine, as well as GH and TSH which are inhibited by somatostatin
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones

Anterior Pituitary Hormones
- growth hormone (GH), luteinizing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), adrenocorticotropic hormone (ACTH), and prolactin (PRL)

Posterior Pituitary (Hypothalamic) Hormones
- antidiuretic hormone (ADH) and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus, these hormones are stored and released from the posterior pituitary

Table 15. The Physiology and Action of Pituitary Hormones

**Growth Hormone**

**GH DEFICIENCY**
- cause of short stature in children (see Pediatrics, P26)
- controversial significance in adults; often not clinically apparent, may present as fatigue

**GH EXCESS**

**Etiology**
- GH secreting pituitary adenoma, carcinoid or pancreatic islet tumours secreting ectopic GHRH resulting in excess GH

**Pathophysiology**
- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in GH excess states, secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

**Clinical Features**
- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly
- enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, thickening of skin, increased sebum production, sweating, acne, sebaceous cysts, fibroma mollusca, acanthosis nigricans, arthralgia, carpal tunnel syndrome, degenerative osteoarthritis, barrel chest, thyromegaly, renal calculi, HTN, cardiomyopathy, obstructive sleep apnea, colonic polyps, erectile dysfunction, menstrual irregularities, and DM

**Risks Associated with GH Excess**
- Cardiac disease (e.g. CAD, cardiomegaly, cardiomyopathy) in 1/3 of patients, with a doubling of risk of death from cardiac disease
- HTN in 1/3 of patients
- Risk of cancer (particularly GI) increased 2-fold to 3-fold
Pituitary Gland

Investigations
- elevated serum insulin-like growth factor-1 (IGF-1) is usually the first line diagnostic test
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening or enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

Treatment
- surgery, octreotide (somatostatin analogue), dopamine agonist (bromocriptine/cabergoline), GH receptor antagonist (pegvisomant), radiation

Prolactin

HYPERPROLACTINEMIA

Etiology
- pregnancy and breastfeeding
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumours may be induced by estrogen and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, antihypertensives, anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H2-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big big prolactin)

Clinical Features
- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, erectile dysfunction

Investigations
- serum PRL, TSH, liver enzyme tests, creatinine, macroprolactin level in select cases
- MRI of the sella turcica in select cases

Treatment
- long-acting dopamine agonist: bromocriptine, cabergoline, or quinagolide
- surgery ± radiation (rare)
- prolactin-secreting tumours are often slow-growing and sometimes require no treatment
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

Thyroid Stimulating Hormone

see Thyroid, E20

Adrenocorticotropic Hormone

see Adrenal Cortex, E29

Luteinizing Hormone and Follicle Stimulating Hormone

HYPOGONADOTROPIC HYPOGONADISM

Etiology
- primary/congenital: Kallmann syndrome, CHARGE syndrome, GnRH insensitivity
- secondary: CNS or pituitary tumours, pituitary apoplexy, brain/pituitary radiation, drugs (GnRH agonists/antagonists, glucocorticoids, narcotics, chemotherapy, drugs causing hyperprolactinemia), functional deficiency due to another cause (hyperprolactinemia, chronic systemic illnesses, eating disorders, hypothyroidism, DM Cushing's disease), systemic diseases (hemochromatosis, sarcoido-sis, histiocytosis)
**Clinical Features**

- hypogonadism, amenorrhea, erectile dysfunction (see Urology, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development

**Treatment**

- combined FSH/LH hormone therapy, human chorionic gonadotropin (hCG), rFSH, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

**HYPERGONADOTROPIC HYPOGONADISM**

- hypogonadism due to impaired response of the gonads to FSH and LH

**Etiology**

- congenital:
  - chromosomal abnormalities (Turner's syndrome, Klinefelter syndrome, XX gonadal dysgenesis)
  - enzyme defects (17α-hydroxylase deficiency, 17, 20-lyase deficiency)
  - gonadotropin resistance (Leydig cell hypoplasia, FSH Insensitivity, pseudohypoparathyroidism type 1A)

- acquired:
  - gonadal toxins (chemotherapy, radiation)
  - drugs (glucocorticoids, antiandrogens, opioids, alcohol)
  - infections (STIs, Mumps)
  - gonadal failure in adults (androgen decline and testicular failure in men, premature ovarian failure and menopause in women)

**Clinical Features**

- hypogonadism, amenorrhea, erectile dysfunction (see Urology, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development, low libido, infertility

**Treatment**

- hormone replacement therapy consisting of androgen (for males) and estrogen (for females) administration

---

**Antidiuretic Hormone**

**DIABETES INSIPIDUS**

**Definition**

- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

**Etiology and Pathophysiology**

- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, stalk lesion, hydrocephalus, histiocytosis X, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

**Clinical Features**

- passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism

**Diagnostic Criteria**

- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
- response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

**Treatment**

- DDAVP/vasopressin for central DI
- chlorpropamide, clofibrate, thiazides, NSAIDs, or carbamazepine as second line or for partial DI
- nephrogenic DI treated with solute restriction NSAIDs and thiazide diuretics; DDAVP (if partial)

---

**SYNDROME OF INAPPROPRIATE ADH SECRETION**

**Diagnostic Criteria**

- hyponatremia with corresponding plasma hypo-osmolality, urine sodium concentration above 40 mEq/L, urine less than maximally diluted (>100 mOsm/kg), euvolemia (edema absent), and absence of adrenal, renal, or thyroid insufficiency
Etiology and Pathophysiology
- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain Barré syndrome)
- respiratory disease (TB, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotinamide, morphine, DDAVP, oxytocin)

Clinical Features
- symptoms of hyponatremia: headaches, nausea, vomiting, muscle cramps, tremors, cerebral edema
  If severe (confusion, mood swings, hallucinations, seizures, coma)

Treatment
- treat underlying cause, fluid restriction (800-1000 mL/day), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), and demeclocycline (antibiotic with anti-ADH properties, rarely-used)
  fludrocortisone, furosemide

Pituitary Pathology

PITUITARY ADENOMA (see Neurosurgery, NS13)

Clinical Features
- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies), headaches; increased ICP is rare
  - hypofunction
  - hyperfunction
    - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumour)
    - tumours secreting LH, FSH, and TSH are rare

Investigations
- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing
- hypothalamic pituitary hormonal function

HYPOPITUITARISM

Etiology (The Eight Is)
- Invasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- Infarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered level of consciousness; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
  - syphilis, TB, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
  - severe head trauma
- Immunologic
  - autoimmune destruction
- Iatrogenic
  - following surgery or radiation
- Idiopathic
  - familial forms, congenital midline defects

Clinical Features
- symptoms depend on which hormone is deficient:
  - ACTH: fatigue, weight loss, hypoglycemia, anemia, hyponatremia, failure to thrive and delayed puberty in children
  - GH: short stature in children
  - TSH: tiredness, cold intolerance, constipation, weight gain, hair loss
  - LH and FSH: oligo- or amenorrhea, infertility, decreased facial/body hair and muscle mass in men, delayed puberty
  - Prolactin: inability to breastfeed
  - ADH: symptoms of diabetes insipidus (extreme thirst, polydipsia, hypernatremia)
  - Oxytocin: usually asymptomatic- only needed during labour and breastfeeding

SIADH vs. Cerebral Salt Wasting (CSW)
CSW can occur in cases of subarachnoid hemorrhage. Na+ is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

Presentations of Pituitary Lesions
- Mass effect (visual field defects, diplopia, ptosis, headaches, CSF leak)
- Hyperfunction
- Hypofunction

Important Deficiencies to Recognize are:
- Adrenal insufficiency
- Hypothyroidism
- Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

The Pituitary Hormones
Order they are usually lost with compression by a mass:
"Go Look For The Adenoma Please"
GH, LH, FSH, TSH, ACTH, PRL + posterior pituitary hormones: ADH and oxytocin

The Pituitary Gland
Endocrinology
Toronto Notes 2018
Thyroid Hormones

Figure 8. Thyroid hormone synthesis

Synthetic Function of Thyroid Gland
- The synthesis of thyroid hormones T3 (thyroxine) and T4 (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, digestion of thyroglobulin, and release of T3 and T4.
- 85% of T4 is converted to T3 or reverse T3 (RT3) in the periphery by deiodinases.
- RT3 is metabolically inactive but produced in times of stress to decrease metabolic activity.
- The plasma T3 pool is derived from the peripheral conversion of T4.
- Calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells.
- Calcitonin functions by inhibiting osteoclast activity and increasing renal calcium excretion.

Role of Thyroid Hormones
- Thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors.
- Action of these hormones is diffuse, effecting nearly every organ system.
- Thyroid hormones have different tissue-specific actions determined by the expression of the types of thyroid receptor isoform and the local production of T4.
- They increase the basal metabolic rate including: increased Na+/K+ ATPase activity, increased O2 consumption, increased respiration, heat generation, and increased cardiovascular activity.
- Thyroid hormones also play crucial role during fetal life in both neurological and somatic development.

Patterns of Hormone Levels

</tr>
<tr>
<td>2° Hypo</td>
<td>↓</td>
<td>↓</td>
</tr>
</tbody>
</table>
Regulation of Thyroid Function
- extrathyroidal:
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators)
  - T3 negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- intrathyroidal (autoregulation):
  - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
  - there is varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of T3 to T4 in iodide deficiency
  - increased activity of peripheral 5’ deiodinase in hypothyroidism increases T3 production despite low T4 levels

Tests of Thyroid Function and Structure

TSH
- sensitive TSH (sTSH) is the best test for assessing thyroid function
- hyperthyroidism:
  - primary: TSH is low because of negative feedback from increased levels of circulating T3 and T4
  - secondary: increased TSH results in increased T3 and T4
- hypothyroidism:
  - primary: increased TSH (most sensitive test) because of less negative feedback from T3 and T4
  - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

Free T3 and Free T4
- standard assessment of thyroid function measures TSH and, if necessary, free T4. Free T3 should only be measured in the small subset of patients with hyperthyroidism and suspected T3 toxicosis. TSH would be suppressed, free T4 normal, and free T3 elevated

Thyroid Autoantibodies
- thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies (TPOAb), and TSH receptor antibodies (TRAB) of the blocking variety are increased in Hashimoto’s disease; normal variant in 10-20% of individuals
- TRABs of the stimulating variety are also referred to as thyroid stimulating immunoglobulins (TSI) and cause Graves’ disease. However, both TRAB receptor blocking and stimulating antibodies are seen in patients with Graves’ disease

Plasma Thyroglobulin
- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- normal or elevated levels may suggest persistent, recurrent, or metastatic disease

Serum Calcitonin
- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma or family history of MEN IIa or IIb syndromes
- used to monitor for residual or recurrent medullary thyroid cancer

Thyroid Imaging/Scans
- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S:
  - to measure size of gland, solid vs. cystic nodule, facilitate fine needle aspirate biopsy (FNAB)
  - radioisotope thyroid scan (Technetium-99)
  - test of structure: order if there is a thyroid nodule and patient is hyperthyroid with low TSH
  - differentiates between hot (functioning → excess thyroid hormone production) and cold (non-functioning) nodules
  - hot nodule → very low chance malignancy; treat hyperthyroidism
  - cold nodule → ~5% chance malignancy; further workup required (U/S and FNAB)
- radioactive iodine uptake (RAIU):
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland in vivo
  - if ↑ uptake (ie incorporated), gland is overactive (hyperthyroid)
  - if ↓ uptake (ie not incorporated), gland is leaking thyroid hormone (e.g. thyroiditis, exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye which has high iodine content)
- see Figure 9, Approach to the Evaluation of a Thyroid Nodule, E28 for further information regarding the utility of these scans

Thyroid Biopsy
- fine needle aspiration (FNA) for cytology
- differentiates between benign and malignant disease
- best done under U/S guidance
- accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

Drugs Affecting Thyroid Function

**Thyrotoxicosis**
- Lithium plays an inhibitory role in thyroid hormone release, resulting in clinical hyperthyroidism and goitre.
- Amiodarone, a class III anti-arrhythmic drug contains 2 atoms of iodine per molecule and is structurally similar to thyroid hormones, and may exert antagonistic effects on TSH receptors. It is also shown to inhibit type I deiodinases resulting in low T3 and high T4 levels. Amiodarone-induced hyperthyroidism occurs in 5-15% of patients on amiodarone. AHT can also occur in people without pre-existing thyroid dysfunction.
- Amiodarone-induced thyrotoxicosis (AIT) occurs in 2-12% of patients on amiodarone. This may be due to either an increased iodine load in patients with previously autonomous thyroid (Graves’ disease, toxic multinodular goitre), or amiodarone-induced destructive thyroiditis.

**Signs and Symptoms of HYPERthyroidism**
- Tremor
- Heart rate up
- Yawning (fatigued)
- Restlessness
- Oligomenorrhea/amenorrhea
- Intolerance to heat
- Diarrhea
- Irritability
- Sweating
- Muscle wasting/weight loss

**Common Etiologies**

</table>

Treatment
- thionamides: propylthiouracil (PTU) or methimazole (MMI); MMI recommended (except in first trimester pregnancy)
- β-blockers for symptom control
- radioactive iodine thyroid ablation for Graves' disease
- surgery in the form of hemi, subtotal, or complete thyroidectomy

Graves' Disease

Definition
- an autoimmune disorder characterized by autoantibodies to the TSH receptor that leads to hyperthyroidism

Epidemiology
- most common cause of thyrotoxicosis
- occurs at any age with peak in 3rd and 4th decade
- F:M = 7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA B8 and DR3
- may be associated with other inherited autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

Etiology and Pathophysiology
- autoimmune disorder due to a defect in T-suppressor cells
- B lymphocytes produce TSI that binds and stimulates the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, lithium therapy, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) is a result of increased tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and displacement of the eyeball forward
- dermopathy may be related to increased glycosaminoglycan deposition

Clinical Features
- signs and symptoms of thyrotoxicosis
- diffuse thyroid goitre ± thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity (plus signs of hyperthyroidism: lid retraction, characteristic stare)
- dermopathy (rare): pretibial myxedema (thickening of dermis that manifests as non-pitting edema)
- acropachy: clubbing and thickening of distal phalanges

Investigations
- low TSH
- increased free T4 (and/or increased T3)
- positive for TSI (specific but not sensitive for Graves' disease)
- increased radioactive iodine (I 131) uptake
- homogeneous uptake on thyroid scan (only do this test in the presence of nodule)
**Treatment**

- thionamides: propylthiouracil (PTU) or methimazole (MMI)
  - PTU and MMI inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of isotopotides
  - PTU also inhibits peripheral deiodination of T4 to T3
  - continue treatment until remission occurs (20-40% of patients achieve spontaneous remission at 6-18 mo of treatment)
- small goitre and recent onset are good indicators for long-term remission with medical therapy
- major side effects: hepatitis, agranulocytosis, and fever/arthritis
- minor side effects: rash
- iodinated contrast agents: sodium ipodate and iopanoic acid can inhibit conversion of T4 to T3 and are especially effective in combination with MMI
- MMI preferred vs. PTU due to longer duration of action (once daily for most), more rapid efficacy, and lower incidence of side effects
- in pregnancy: use PTU during first trimester and MMI during second and third trimester. MMI is contraindicated in the first trimester due to risk of aplasia cutis; MMI is preferred in the second and third trimester due to the potential risk of hepatotoxicity with PTU in the second and third trimesters
- symptomatic treatment with β-blockers
- thyroid ablation with radioactive ¹³¹I if PTU or MMI trial does not produce disease remission
- high incidence of hypothyroidism after ¹³¹I requiring lifelong thyroid hormone replacement
- con raindeicated in pregnancy
- may worsen ophthalmopathy
- subtotal or total thyroidectomy (indicated for large goitres, suspicious nodule for Ca, if patient is intolerant to thionamides and refusing RAI ablation)
- risks include hypoparathyroidism and vocal cord palsy
- ophthalmopathy/orbitopathy
  - smoking cessation is important
  - prevent drying of eyes
  - high dose prednisone in severe cases
  - orbital radiation, surgical decompression

**Prognosis**

- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- lifetime follow-up needed
- risk of relapse is 37%, 21%, 6% in thionamides, radioiodine ablation, and surgery groups, respectively

## Subacute Thyroiditis (Thyrotoxic Phase)

**Definition**

- acute inflammatory disorder of the thyroid gland characterized by an initial thyrotoxic state followed by hypothyroidism eventually followed by euthyroidism in most cases
- two subtypes: painful (“De Quervain’s”) and painless (“Silent”)

**Etiology and Pathophysiology**

- acute inflammation of the thyroid gland characterized by giant cells and lymphocytes
- disruption of thyroid follicles by inflammatory process results in the release of stored hormone rather than excessive production of new thyroid hormone
- painful = viral (usually preceded by URI), De Quervain’s (granulomatous thyroiditis)
- painless = postpartum, auto-immune, lymphocytic
- occurs in 5-10% of postpartum mothers and is symptomatic in 1/3 of patients

**Clinical Features**

- painful (thyroid, ears, jaw, and occiput) or painless
- fever and malaise may be present, especially in De Quervain’s
- postpartum: thyrotoxicosis 2-3 mo postpartum with a subsequent hypothyroid phase at 4-8 mo post partum
- may be mistakenly diagnosed as postpartum depression

**Laboratory Investigations**

- initial elevated free T₄, T₃, low TSH, RAIU markedly reduced
- marked elevation of ESR in painful variety only
- as disease progresses values consistent with hypothyroidism may appear

**Treatment**

- painful – high dose NSAIDs prednisone may be required for severe pain, fever, or malaise
- iodinated contrast agents (e.g. iopanoic acid, ipodate) to inhibit peripheral conversion of T₄ to T₃
- β-adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms in both subtypes
- if symptomatically hypothyroid, may treat short-term with thyroxine

**Prognosis**

- full recovery in most cases, but permanent hypothyroidism in 10% of painless thyroiditis
- postpartum: most resolve spontaneously without need for supplementation, however may recur with subsequent pregnancies
Toxic Adenoma/Toxic Multinodular Goitre

Etiology and Pathophysiology
- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T3 and T4
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre [Plummer's disease])

Clinical Features
- goitre with adenomatous changes
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- seen most frequently in elderly people, often with presentation of atrial fibrillation

Investigations
- low TSH, high T3 and T4
- thyroid scan with increased RAIU in nodule(s) and suppression of the remainder of the gland

Treatment
- initiate therapy with PTU or MMI to attain euthyroid state
- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- β-blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

Thyrotoxic Crisis/Thyroid Storm

Definition
- acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism – medical emergency!
- rare, but serious with mortality rate between 10-30%

Etiology and Pathophysiology
- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

Differential Diagnosis
- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

Clinical Features
- hyperthyroidism
- extreme hyperthermia (≥40°C), tachycardia, vomiting, diarrhea, vascular collapse, hepatic failure with jaundice, and confusion
- tachyarrhythmia, CHF, shock
- mental status changes ranging from delirium to coma

Laboratory Investigations
- increased free T3 and T4, undetectable TSH
- ± anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

General Measures
- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or other β blockers that additionally decrease peripheral conversion of T3 → T4 can be used, but should be used with caution in CHF patients as it may worsen condition

Specific Measures
- PTU is the anti-thyroid drug of choice and is used in high doses
- give iodide, which acutely inhibits the release of thyroid hormone, one hour after the first dose of PTU is given
  - Sodium iodide 1 g IV drip over 12h q12h
  - Lugol's solution 2-3 drops q8h
  - Potassium iodide (SSKI) 5 drops q8h
- dexamethasone 2-4 mg IV q6h for the first 24-48 hours lowers body temperature and inhibits peripheral conversion of T3 → T4

Prognosis
- probably <20% mortality rate if rapidly recognized and treated
Hypothyroidism

**Definition**
- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

**Epidemiology**
- 2-3% of general population
- F:M = 10:1
- 10-20% of women over age 50 have subclinical hypothyroidism (normal T₄, TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

**Etiology and Pathophysiology**
- primary hypothyroidism (90%)
  - inadequate thyroid hormone production secondary to intrinsic thyroid defect
  - iatrogenic: post-ablative (1-131 or surgical thyroidectomy)
  - autoimmune: Hashimoto’s thyroiditis, chronic thyroiditis, idiopathic, burnt out Graves’
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4,000 births)
- secondary hypothyroidism: pituitary hypothyroidism
  - insufficiency of pituitary TSH
  - tertiary hypothyroidism: hypothalamic hypothyroidism
  - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

**Table 20. Clinical Features of Hypothyroidism**

**Clinical Features**

**Table 20. Clinical Features of Hypothyroidism**

| General | Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroGLOSSIA |
| CVS     | Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart |
| Respiratory | Decreased exercise capacity, hyponatremia secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroGLOSSIA |
| GI      | Weight gain despite poor appetite, constipation |
| Neurology | Paresthesia, slow speech, muscle cramps, delay in relaxation phase of deep tendon reflexes (“hung reflexes”), carpal tunnel syndrome, asymptomatic increase in CK, seizures |
| GU     | Menorrhagia, amenorrhea, impotence |
| Dermatology | Puffiness of face, periorbital edema, cool and pale, dry and rough skin, hair dry and coarse, eyebrows thinned (lateral 1/3), discoloration (carotenemia) |
| Hematology | Anemia: 10% pernicious due to presence of anti-periartial cell antibodies with Hashimoto’s thyroiditis |

**Treatment**
- L-thyroxine (dose range: 0.05-0.2 mg PO OD ~1.6 μg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism
  - monitor via measurement of free T₄ (TSH is unreliable in this setting)

**CONGENITAL HYPOTHYROIDISM**
- see Pediatrics P28
Hashimoto’s Thyroiditis

- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from the start
  - associated with thyroid lymphoma

Etiology and Pathophysiology

- defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na+/I– symporter

Risk Factors

- female gender (F:M = 7:1)
- genetic susceptibility: increased frequency in patients with Down’s syndrome, Turner’s syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake
- stress and infection

Investigations

- high TSH, low T4 (not necessary to measure T3 as it will be low as well)
- presence of anti-thyroid peroxidase (TPOAb) and thyroglobulin antibodies (TgAb) in serum

Treatment

- if hypothyroid, replace with L-thyroxine (analog of T4)

Myxedema Coma

Definition

- severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events – medical emergency!
- rare high level of mortality when it occurs (up to 40%, despite therapy)

Clinical Features

- hallmark symptoms of decreased mental status and hypothermia; hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized edema often present

Investigations

- decreased T4, increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

Treatment

- aggressive treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider T3 therapy
- supportive measures: mechanical ventilation, vasopressor drugs, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
- monitor for arrhythmia

Sick Euthyroid Syndrome

Definition

- changes in circulating thyroid hormones amongst patients with serious illness, trauma, or stress
- not due to intrinsic thyroid or pituitary disease
- initially low free T3 may be followed by low TSH and if severe illness low free T4
- with recovery of illness, TSH may overshoot and become transiently high

Pathophysiology

- abnormalities include alterations in
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
  - thyroid function itself
- may be protective during illness by reducing tissue catabolism
**Labs**
- initially decreased free T₃ followed by decreased TSH and finally decreased free T₄

**Treatment**
- treat the underlying disease; thyroid hormone replacement worsens outcomes
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

**Non-Toxic Goitre**

**Definition**
- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

**Pathophysiology**
- the appearance of a goitre is more likely during adolescence, pregnancy, and lactation because of increased thyroid hormone requirements
  - early stages goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

**Etiology**
- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

**Treatment**
- remove goitrogens
- radioiodine therapy (need very high doses given low iodine uptake, used as last resort)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary for severe compressive symptoms

**Complications**
- compression of neck structures causing stridor, dysphagia, pain, and hoarseness
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

**Thyroid Nodules**

**Definition**
- clearly defined discrete mass, separated from the thyroid parenchyma
- palpable nodules are found in approximately 5% of women and 1% of men

**Etiology**
- benign tumours (e.g. colloid nodule, follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

**Investigations**

**Figure 9. Approach to the evaluation of a thyroid nodule**
Adapted from Dr. J Goguen, University of Toronto, MMMD 2013

**Thyroid Malignancies**
- see Otolaryngology, OT37
Adrenal Cortex

Adrenocorticotropic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400; trough: 1800-2400)
- secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
- stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a limited extent, mineralocorticoids
- some melanocyte stimulating activity

Adrenocortical Hormones

Aldosterone
- a mineralocorticoid which regulates extracellular fluid (ECF) volume through Na⁺ and K⁺ excretion (stimulates distal tubule Na⁺/K⁺ ATPase)
- regulated by the renin-angiotensin-aldosterone system (Figure 12)
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone↑ volume expansion) and short loop (angiotensin II↑ peripheral vasoconstriction)

Cortisol
- a glucocorticoid, regulated by the HPA axis
- involved in regulation of metabolism; counteracts the effects of insulin
- support blood pressure, vasomotor tone
- also involved in regulation of behaviour and immunosuppression
Table 21. Physiological Effects of Glucocorticoids

<table>

</tbody>
</table>

**Androgens**

- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are dihydroepiandrosterone (DHEA), androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age

**Adrenocortical Functional Workup**

**STIMULATION TEST**

- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

1. **Tests of Glucocorticoid Reserve**

   - Cosyntropin (ACTH analogue) Stimulation Test
     - give 1 µg or 250 µg cosyntropin IV, then measure plasma cortisol levels at time 0, 30, and 60 min
     - physiologic response: stimulated plasma cortisol of >500 nmol/L
     - inappropriate response: inability to stimulate increased plasma cortisol
   - insulin tolerance is the gold standard test used to diagnose adrenal insufficiency (see **Pituitary Gland**, E15)

**SUPPRESSION TESTS**

- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

1. **Tests of Pituitary-Adrenal Suppressibility**

   Dexamethasone (DXM) Suppression Test
   - principle: DXM suppresses pituitary ACTH, plasma cortisol should be lowered if HPA axis is normal
   - **Screening Test**: Overnight DXM Suppression Test
     - oral administration of 1 mg DXM at midnight measure plasma cortisol levels the following day at 8 am
     - physiologic response: plasma cortisol <50 nmol/L, with 50-140 nmol/L being a “grey zone” (cannot be certain if normal or not)
     - inappropriate response: failure to suppress plasma cortisol
     - <20% false positive results due to obesity, depression, alcohol, other medications
   - **Confirmatory Test**: other testing is used to confirm the diagnosis, such as:
     - 24 h urine free cortisol (shows overproduction of cortisol)
     - midnight salivary cortisol (if available), shows lack of diurnal variation
     - inappropriate response: remains high (normally will be low at midnight)

2. **Tests of Mineralocorticoid Suppressibility**

   - principle: expansion of extracellular fluid volume (ECFV); plasma aldosterone should be lowered if HPA axis is normal
   - ECFV Expansion with Normal Saline (NS)
     - IV infusion of 500 mL/h of NS for 4 h, then measure plasma aldosterone levels
     - plasma aldosterone >277 pmol/L is consistent with primary hyperaldosteronism, <140 pmol/L is normal
     - inappropriate response: failure to suppress plasma aldosterone
**Mineralocorticoid Excess Syndromes**

**Figure 13. Approach to mineralocorticoid excess syndromes**

**Definition**
- primary hyperaldosteronism (PH): excess aldosterone production (intra-adrenal cause)
- secondary hyperaldosteronism (SH): aldosterone production in response to excess RAAS (extra-adrenal cause)

**Etiology**
- primary hyperaldosteronism
  - aldosterone-producing adrenal adenoma (Conn's syndrome)
  - bilateral or idiopathic adrenal hyperplasia
  - glucocorticoid-remediable aldosteronism
  - aldosterone-producing adrenocortical carcinoma
  - unilateral adrenal hyperplasia
- secondary hyperaldosteronism

**Clinical Features**
- HTN
- hypokalemia (may have mild hypernatremia), metabolic alkalosis
- normal K⁺, low Na⁺ in SH (low effective circulating volume leads to ADH release) edema
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, MI
- fatigue, weakness, paresthesia, headache; severe cases with tetany, intermittent paralysis

**Diagnosis**
- investigate plasma aldosterone to renin ratio in patients with HTN and hypokalemia
- confirmatory testing for PH: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECF volume expansion)
- imaging: CT adrenal glands

**Table 22. Diagnostic Tests in Hyperaldosteronism**

<table>
<thead>
<tr>
<th>Test</th>
<th>Primary Hyperaldosteronism</th>
<th>Secondary Hyperaldosteronism</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>A) Oral test</td>
<td>↑ plasma aldosterone</td>
<td></td>
</tr>
<tr>
<td>B) IV saline test</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Treatment**
- inhibit action of aldosterone: spironolactone, eplerenone, triam erene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause
Cushing’s Syndrome

Definition
- results from chronic glucocorticoid excess (endogenous or exogenous sources)

Etiology
- ACTH-dependent (85%) – bilateral adrenal hyperplasia and hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing’s disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumours)
- ACTH-independent (15%)
  - long-term use of exogenous glucocorticoids
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia

Clinical Features
- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face, supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism if ACTH-dependent

Diagnosis
- complete a drug history to exclude iatrogenic Cushing’s
- perform one of: 1) 24 h urine free cortisol, 2) dexamethasone suppression test, or 3) late night salivary cortisol
- consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM)
- confirm with one of the remaining tests if necessary (do not rely on random cortisol, insulin tolerance, loperamide, or urinary 17-ketosteroid tests)

Treatment
- adrenal
  - adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation post-operatively
  - carcinoma: adjunctive chemotherapy often not useful (frequent metastases, poor prognosis)
  - medical treatment: mitotane, ketoconazole to reduce cortisol
- pituitary
  - trans-sphenoidal resection, with glucocorticoid supplement post-operatively
  - if surgery delayed, contraindicated or unsuccessful consider medical management ex. adrenal enzyme inhibitors, glucocorticoid receptor antagonist
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis)
  - surgical resection, if possible; chemotherapy/radiation for primary tumour
  - medical treatment with mitotane or ketoconazole to reduce cortisol synthesis. Often required when surgery is delayed, contraindicated, or unsuccessful

Congenital Adrenal Hyperplasia
- see Pediatrics, P29

Hyperandrogenism

Definition
- state of having excessive secretion of androgens (DHEA, DHEA sulfate, testosterone)

Etiology and Pathophysiology

Clinical Features

Females

- hirsutism
  - male pattern growth of androgen-dependent termina body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism
- virilization
  - masculinization: hirsutism, temporal balding, clitoral enlargement, deepening of voice, acne
  - increase in musculature
- defeminization
  - loss of female secondary sex characteristics (i.e. amenorrhea, ↓ breast size, infertility)

Males

- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production, and spermatogenesis

Investigations

- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose, lipids, 75 g OGTT

Treatment

- discontinue causative medications
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase sex hormone binding globulin, which binds androgens>estrogens; reduce ovarian production of androgens)
- surgical resection of tumour
- low dose glucocorticoid ± mineralocorticoid if CAH suspected
- treat specific causative disorders, e.g. tumours, Cushing’s, etc.
- cosmetic therapy (laser, electrolysis)

Adrenocortical Insufficiency

Definition

- state of inadequate cortisol and/or aldosterone production by the adrenal glands

Etiology

PRIMARY (ADDISON’S DISEASE)

Table 24. Etiology of Primary Adrenocortical Insufficiency

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

Treatment
- acute condition – can be life-threatening
  - IV NS in large volumes (2-3 L); add D5W if hypoglycemic from adrenal insufficiency
  - hydrocortisone 50-100 mg IV q6-8h for 24h, then gradual tapering
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-20 mg total daily dose, in 2-3 divided doses, highest dose in the AM
  - Florinef (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
  - major stress (e.g. surgery, trauma) requires 150-300 hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

Adrenal Medulla

Catecholamine Metabolism
- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

Pheochromocytoma

Definition
- rare catecholamine secreting tumour derived from chromaffin cells of the sympathetic system

Epidemiology
- most commonly a single tumour of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

Etiology and Pathophysiology
- most cases sporadic (80%)
- familial: associated with multiple endocrine neoplasia II (MEN IIA and IIB 50% penetrance; i.e. 50% of people with the mutation get pheochromocytoma), von Hippel-Lindau (10-20% penetrance), paraganglioma (20% penetrance), or neurofibromatosis type 1 (0.1-5% penetrance)
- tumours, via unknown mechanism, able to synthesize and release excessive catecholamines
Clinical Features
• 50% suffer from paroxysmal HTN; the rest have sustained HTN
• classic triad (not found in most patients): episodic "pounding" headache, palpitations/tachycardia, diaphoresis
• other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
• other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
• symptoms may be triggered by stress, exertion anesthesia, abdominal pressure, certain foods (especially tyramine containing foods)

Investigations
• urine catecholamines
  ■ increased catecholamine metabolites (metanephrines) and free catecholamines
  ■ plasma metanephrines if available (most sensitive)
  • cut-off values will depend on assay used
• CT abdomen
  if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

Treatment
• surgical removal of tumour (curative) with careful pre- and post-operative ICU monitoring
• adequate pre-operative preparation
  • α-blockade for BP control: doxazosin or calcium channel blockers (10-21 d pre-operative), IV phentolamine (perioperative, if required)
  • β-blockade for HR control once α blocked for a few days
  • metyrosine (catecholamine synthesis inhibitor) + phenoxybenzamine or prazosin
  • volume restoration with vigorous salt-loading and fluids
• rescreen urine 1-3 mo post-operatively
• screen urine in first degree relatives; genetic testing in patients <50 yr old

Disorders of Multiple Endocrine Glands

Multiple Endocrine Neoplasm
• neoplastic syndromes involving multiple endocrine glands
• tumours of neuroectodermal origin
• autosomal dominant inheritance with variable penetrance
• genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN II
  • early cure and prevention of medullary thyroid cancer

Table 26. MEN Classification

<td>MTC: most common component, more aggressive and earlier onset than MEN IIa HTN, palpitations, headache, sweating Chronic constipation; megacolon Marfanoid habitus [no aortic abnormalities]</td>
</tr>
</tbody>
</table>

Investigations

- **MEN I**
  - laboratory
    - may consider genetic screening for MEN-1 mutation in index patients
    - if a mutation is identified, screen family members who are at risk
  - gastrinoma: elevated serum gastrin level (>200 ng/mL) after IV injection of secretin
  - insulinoma: reduced fasting blood glucose (hypoglycemia) with elevated insulin and C-peptide levels
  - glucagonoma: elevated blood glucose and glucagon levels
  - pituitary tumours: assess GH, IGF-1, and prolactin levels (for over-production), TSH, free T4, 8 AM cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
  - hyperparathyroidism: serum Ca²⁺ and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - MRI for pituitary tumours, gastrinoma, insulinoma

- **MEN II**
  - laboratory
    - genetic screening for RET mutations in all index patients
    - if a mutation is identified, screen family members who are at risk
  - calcitonin levels (MTC); urine catecholamines and metanephrines (pheochromocytoma); serum Ca²⁺, albumin, and PTH levels (hyperparathyroidism)
  - pentagastrin ± calcium stimulation test if calcitonin level is within reference range
  - FNA for thyroid nodules-cytology
  - imaging
    - CT or MRI of adrenal glands, metaiodobenzylguanidine (MIBG) scan for pheochromocytoma
    - octreoscan and/or radionuclide scanning for determining the extent of metastasis

Treatment

- **MEN I**
  - medical
    - proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
    - cabergoline or other dopamine agonists to suppress prolactin secretion
    - somatostatin for symptomatic carcinoid tumours
  - surgery for hyperparathyroidism, insulinoma, glucagonoma, pituitary tumours (if medical treatment fails for the latter)
    - trans-sphenoidal approach with prn external radiation

- **MEN II**
  - surgery for MEN IIa with pre-operative medical therapy
    - prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
    - α blocker for at least 10-21 d for pheochromocytoma pre-operatively
    - hydration, calcitonin, IV bisphosphonates for hypercalcemia

**Calcium Homeostasis**

- normal total serum Ca²⁺: 2.2-2.6 mmol/L
- ionic/free Ca²⁺ levels: 1.15-1.31 mmol/L
- serum Ca²⁺ is about 40% protein bound (mostly albumin), 50% ionized, and 10% complexed with PO₄³⁻ and citrate
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D
- actions mainly on three organs: GI tract, bone, and kidney

Figure 15 Parathyroid hormone (PTH) regulation

**Hypercalcemia**

**Definition**
- total corrected serum Ca\(^ {2+} \) >2.6 mmol/L OR ionized Ca\(^ {2+} \) >1.35 mmol/L.

**Approach to Hypercalcemia**
1. Is the patient hypercalcemic? (correct for albumin – see sidebar)
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low? If phosphate is high/normal is the level of vitamin D metabolites high or low?
Clinical Features
• symptoms depend on the absolute Ca\(^{2+}\) value and the rate of its rise (may be asymptomatic)

Table 28. Symptoms of Hypercalcemia

</tr>
</tbody>
</table>

** Hypercalcemic crisis usually >4 mmol/L or 16 mg/dL: primary symptoms include oliguria/anuria and mental status changes including somnolence and eventually coma → this is a medical emergency and should be treated immediately!

Treatment
• treatment depends on the Ca\(^{2+}\) level and the symptoms
• treat the underlying cause of the hypercalcemia
• treat acute, symptomatic hypercalcemia aggressively
• mild asymptomatic hypercalcemia; monitor, avoid: thiazide, volume depletion, high Ca\(^{2+}\) diet, lithium, bed rest

**The symptoms and signs of hypercalcemia include:**
"Bones, stones, groans, and psychiatric overtones"

**The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia:**
• Usually occurs in the later stages of disease
• Most commonly seen in lung, renal, breast, ovarian, and squamous tumours, as well as lymphoma and multiple myeloma

Mechanisms:
• Secretion of parathyroid hormone-related protein (PThRPe) which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
• Cytokines in multiple myeloma
• Calcitriol production by lymphoma
• Osteolytic bone metastases direct effect
• Excess PTH in parathyroid cancer
Approach to Hypocalcemia
1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the Mg\(^{2+}\) level low?

Approach to Treatment
- correct underlying disorder
- treat concurrent hypomagnesemia
- mild and symptomatic (ionized Ca\(^{2+}\) >0.8 mmol/L)
  - treat by increasing dietary Ca\(^{2+}\) by 1000 mg/d
  - calcitriol 0.25 \(\mu\)g/d (especially in renal failure)
- acute or symptomatic hypocalcemia (ionized Ca\(^{2+}\) <0.7 mmol/L)
  - immediate treatment required
  - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion if necessary
  - goal is to raise Ca\(^{2+}\) to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion
  - if PTH recovery not expected requires long-term therapy with calcitriol and calcium
- do not correct hypocalcemia if asymptomatic and suspected to be transient

**Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis**

Metabolic Bone Disease

Osteoporosis

Definition
- a condition characterized by decreased bone mass and microarchitectural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility to fracture
- bone mineral density (BMD) ≥2.5 standard deviations below the peak bone mass for young adults (i.e. T-score ≤–2.5)
- osteopenia: BMD with T-score between –1.0 and –2.5

ETIOLOGY AND PATHOPHYSIOLOGY

Primary Osteoporosis (95% of osteoporosis in women and 80% in men)
- primary type 1: most common in post-menopausal women, due to decline in estrogen, worsens with age
- primary type 2: occurs after age 75, seen in females and males at 2:1 ratio, possibly due to zinc deficiency

Secondary Osteoporosis
- gastrointestinal diseases
  - gastrectomy
  - malabsorption (e.g. celiac disease)
  - chronic liver disease
- bone marrow disorders
  - multiple myeloma
  - lymphoma
  - leukemia
- endocrinopathies
  - Cushing's syndrome
  - hyperparathyroidism
  - hyperthyroidism
  - premature menopause
  - DM
  - hypogonadism
- malignancy
  - secondary to chemotherapy
  - myeloma
- drugs
  - corticosteroid therapy
  - phenytoin
  - chronic hepatic therapy
  - androgen deprivation therapy
  - aromatase inhibitors
- other
  - rheumatologic disorders
  - rheumatoid arthritis
  - SLE
  - ankylosing spondylitis
  - renal disease
  - poor nutrition
  - immobilization
  - COPD (due to disease, tobacco, and glucocorticoid use)

ECHOBOOK
Clinical Features
- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist
  - fragility fractures: fracture with fall from standing height
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
  - x-ray: vertebral compression and crush fractures, wedge fractures, "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

Approach to Osteoporosis
1. assess risk factors for osteoporosis on history and physical
2. decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women ≥65 yr or younger if presence of risk factors
3. initial investigations
   - all patients with osteoporosis: calcium corrected for albumin, CBG, creatinine, ALP, TSH
   - also consider serum and urine protein electrophoresis, celiac workup, and 24 h urinary Ca²⁺ excretion to rule out additional secondary causes
   - 25-OH-Vitamin D level should only be measured after 3–4 mo of adequate supplementation and should not be repeated if an optimal level ≥75 nmol/L is achieved
   - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture
4. assess 10-yr fracture risk by combining BMD result and risk factors (only if ≥50 yr)
   1) WHO Fracture Risk Assessment Tool (FRAX)
   2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
   - approach to management guided by 10-yr risk stratification into low, medium, high risk
5. for all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 33)

**Osteomalacia and Rickets**

- rickets: osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue prior to epiphyseal closure (in childhood)
- osteomalacia: osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue after epiphyseal closure (in adulthood)

**Etiology and Pathophysiology**

**Vitamin D Deficiency**

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency

**Osteomalacia and Rickets**

- malabsorption: p
gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency

**Factors Necessary for Mineralization**

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

**Osteoporosis in Women and Men**

- Vitamin D Deficiency
- Etiology and Pathophysiology
- Figure 18. Physical examination test
- Table 33. Treatment of Osteoporosis in Women and Men
- Osteomalacia and Rickets
• defective 25-hydroxylation
  ■ liver disease
  ■ anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
• loss of vitamin D binding protein
• nephrotic syndrome
• deficient 1-a-25 hydroxylation
• hypoparathyroidism
• renal failure
• pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

MINERALIZATION DEFECT
• abnormal matrix
  ■ osteogenesis imperfecta
  ■ fibrogenesis imperfecta
  ■ axial osteomalacia
• enzyme deficiency
  ■ hypophosphatasia (inadequate ALP bioactivity)
• presence of calcification inhibitors
  ■ bisphosphonates, aluminum, high dose fluoride, anticonvulsants

</table>

• radiologic findings
  ■ pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  ■ loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  ■ changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  ■ others: bowing of tibia, coxa profunda deformity
• bone biopsy: usually not necessary but considered the gold standard for diagnosis

Treatment
• definitive treatment depends on the underlying cause
• vitamin D supplementation
• PO₄³⁻ supplements if low serum PO₄³⁻, Ca²⁺ supplements for isolated calcium deficiency
• bicarbonate if chronic metabolic acidosis

Renal Osteodystrophy

• changes to mineral metabolism and bone structure secondary to chronic kidney disease
• represents a mixture of four types of bone disease:
  ■ osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  ■ adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  ■ osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  ■ mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoid
• metastatic calcification secondary to hyperphosphatemia may occur

Pathophysiology
• metabolic bone disease secondary to chronic renal failure
• combination of hyperphosphatemia (inhibits 1,25(OH)₂-Vit D synthesis) and loss of renal mass (reduced 1-a-hydroxylase)
Clinical Features
- soft tissue calcifications, necrotic skin lesions if vessels involved
- osteodystrophy, generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

Investigations
- serum Ca²⁺-corrected for albumin, PO₄³⁻, PTH, ALP, ± imaging (x-ray, BMD), ± bone biopsy

Treatment
- prevention
- maintenance of normal serum Ca²⁺ and PO₄³⁻ by restricting PO₄³⁻ intake to 1 g OD
- Ca²⁺ supplements; PO₄³⁻ binding agents (calcium carbonate, aluminum hydroxide)
- vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification

Paget’s Disease of Bone

Definition
- a metabolic disease characterized by excessive bone destruction and repair

Epidemiology
- a common disease: 5% of the population, 10% of population >80 yr old
- consider Paget’s disease of bone in older adults with ↑ ALP but normal GGT

Etiology and Pathophysiology
- postulated to be related to a slowly progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

Differential Diagnosis
- primary bone lesions
  - osteogenic sarcoma
  - multiple myeloma
  - fibrous dysplasia
- secondary bone lesions
  - osteitis fibrosa cystica
  - metastases

Clinical Features
- usually asymptomatic (routine x-ray finding or elevated ALP)
- severe bone pain (e.g. pelvis, femur, tibia) is often the presenting complaint
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- skull involvement: headaches, increased hat size, deafness
- increased warmth over involved bones due to increased vascularity
- high output CHF
- hypercalcemia with immobilization
- osteosarcoma

Investigations
- laboratory
  - ↑↑ serum ALP (unless burnt out), Ca²⁺ normal or ↑, PO₄³⁻ normal
  - urinary hydroxyproline ↑ (indicates resorption)
  - imaging
    - confirmation on x-ray required to establish the diagnosis
    - bone scan to evaluate the extent of disease and identify asymptomatic sites
    - skeletal survey: involved bones are denser and expanded with cortical thickening
      - initial lesion may be destructive and radiolucent
      - multiple fissure fractures in long bones

Complications
- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
  - indicated by marked bone pain, new lytic lesions and suddenly increased ALP
- systemic
  - hypercalcemia and nephro lithiasis
  - high output CHF due to increased vascularity

Treatment
- goals: decrease pain, decrease rate of remodelling
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism

<tr>
<th>Comparison of a Single Infusion of Zoledronic Acid with Risedronate for Paget’s Disease</th>
</tr>
</thead>
<tbody>
<tr>
<td>Study: Two identical, randomized, double-blind, actively controlled trials (combined for analysis).</td>
</tr>
<tr>
<td>Patients: 397 men and women who were older than 30 yr of age and had radiologically confirmed Paget’s disease. All but 4 patients had alkaline phosphate levels that were more than twice the upper limit of normal.</td>
</tr>
<tr>
<td>Intervention: One 15-min infusion of 5 mg of zoledronic acid compared with 60 d of oral risedronate (30 mg/d) with follow-up at 6 mo.</td>
</tr>
<tr>
<td>Primary Outcome: Rate of therapeutic response at 6 mo, defined as a normalization of alkaline phosphate levels or a reduction of at least 75% in the total alkaline phosphate excess.</td>
</tr>
<tr>
<td>Results: At 6 mo, 96% of patients receiving zoledronic acid had a therapeutic response (169 of 176), as compared with 74.3% of patients receiving risedronate (127 of 171, p&lt;0.001). Alkaline phosphate levels normalized in 88.6% of patients in the zoledronic acid group and 57.9% of patients in the risedronate group (p&lt;0.001). Zoledronic acid was associated with a shorter median time to a first therapeutic response (84 vs. 89 d, p&lt;0.001). Quality of life increased significantly from baseline at both 3 and 6 mo in the zoledronic acid group and differed significantly from those in the risedronate group at 3 mo. Pain scores improved in both groups. During post trial follow-up (median, 196 d), 21 of 62 patients in the risedronate group had a loss of therapeutic response, as compared with 1 of 113 patients in the zoledronic acid group (p=0.001).</td>
</tr>
<tr>
<td>Conclusions: A single infusion of zoledronic acid produces more rapid, more complete, and more sustained responses in Paget’s disease than does daily treatment with risedronate.</td>
</tr>
</tbody>
</table>
Male Reproductive Endocrinology

Androgen Regulation

- negative feedback may occur by androgens directly or after conversion to estrogen
- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm)
- LH, FSH, total, bioavailable, and/or free testosterone
- human chorionic gonadotropin (hCG) stimulation test
- semen analysis
- semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
- indicated with normal FSH and azoospermia/oligospermia

Hypogonadism and Infertility

- see Urology, U34
- deficiency in gametogenesis or testosterone production

Etiology

- causes include primary (testicular failure), secondary (hypothalamo-pituitary failure), and idiopathic
- primary hypogonadism is more common than secondary

Diagnosis of Testosterone Deficiency Syndrome (aka adult onset primary hypogonadism)

- requires clinical manifestations of testosterone deficiency (see sidebar) AND documented testosterone levels below local lab ranges
- rule out secondary causes

Table 36. Classification and Features of Hypogonadism

E45 Endocrinology

Male Reproductive Endocrinology

Toronto Notes 2018

• treat medically if symptomatic or asymptomatic with ALP >3x normal or planned surgery
  • new evidence indicates treatment may be warranted for all patients without contraindications
  • bisphosphonates, e.g. zoledronic acid 5 mg IV per yr (preferred) OR alendronate 40 mg PO OD x 6 mo OR risedronate 30 mg PO OD x 3 mo
  • calcitonin 50-100 U/d SC if unable to tolerate bisphosphonate
• surgery for fractures, deformity, degenerative changes

Figure 19. Hypothalomo-pituitary-gonadal axis

Two Distinct Features of Primary Hypogonadism

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

Two Features of Secondary Hypogonadism

- Associated with an equivalent decrease in sperm count and serum testosterone
- Less likely to be associated with gynecomastia
Treatment
- goal: testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
- side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
- contraindicated if history of metastatic prostate cancer, breast cancer, severe LUTS associated with BPH, uncontrolled or poorly controlled CHF, PSA > 4, hematocrit > 50%
- testosterone therapy only to treat symptoms of hypogonadism, often results in decreased spermatogenesis by further suppression of hypothalamic-pituitary-gonad axis
  - goal: fertility
  - Treat underlying cause
  - GnRH agonist if hypothalamic dysfunction with intact pituitary, administered SC in pulsatile fashion using an external pump
  - hCG ± recombinant follicular stimulating hormone (rFSH) in cases of either hypothalamic or pituitary lesions
  - Dopamine agonist (eg. bromocriptine, cabergoline) if prolactinoma
  - testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

Other Causes of Male Infertility
- hereditary disorders: Kartagener syndrome (primary ciliary dyskinesia), cystic fibrosis
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vaginal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: TURP, radical prostatectomy, orchectomy

DEFECTS IN ANDROGEN ACTION

Etiology
- complete androgen insensitivity (CAIS)
- partial androgen insensitivity (PAIS)
- 5-a-reductase deficiency
- mixed gonadal dysgenesis
- defects in testosterone synthesis
- undervirilized fertile male syndrome

Clinical Features
- depends on age of onset

Adapted from: UpToDate, 2010; Cecil’s Essentials of Medicine

Erectile Dysfunction

- see Urology, U30

Approach to Male Infertility

Infertility: failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women < 35 yr of age; after 6 mo of regular intercourse without use of contraception in women ≥ 35 yr

History
- Partner status re: infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Prior Surg, Med Hx, STI Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking

P/E
- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

Investigations
Should be considered for couples unable to conceive after 12 mo of unprotected and frequent intercourse. Consider earlier evaluation if suggestive medical Hx and physical, and in women ≥ 35 yr of age
- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Blood work: LH, FSH, testosterone, prolactin, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see Gynecology, GY23)

Treatment
- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, IVF, therapeutic donor insemination, testicular aspiration of sperm, adoption
**Gynecomastia**

**Definition**
- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals

**Etiology**

**Physiologic**
- puberty
- elderly (involutional)
- neonatal (maternal hormone)

**Pathologic**
- endocrinopathies: primary or secondary hypogonadism, hyperthyroidism, extreme hyperprolactinemia, adrenal disease
- tumours: pituitary, adrenal, testicular, breast, ectopic production of hCG
- chronic diseases: cirrhosis, renal, malnutrition (with refeeding)
- drugs: estrogens and estrogen agonists, spironolactone, ketoconazole, cimetidine, digoxin, chemotherapy, marijuana, alcohol
- congenital/genetic: Klinefelter’s syndrome, androgen insensitivity
- other: idiopathic (majority of gynecomastia is classified as idiopathic), familial

**Pathophysiology**
- hormonal imbalance due to increased estrogen activity (increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen) or decreased androgen activity (decreased androgen production, binding of androgen to sex hormone binding globulin SHBG), or androgen receptor blockage

**History**
- recent change in breast characteristics
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

**Physical Exam**
- signs of feminization
- breast
  - rule out red flags suggesting breast cancer: unilateral, eccentric, hard or fixed mass, skin dimpling or retraction, and nipple discharge or crusting
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue
- genito-urinary exam
- stigmata of liver or thyroid disease

**Investigations**
- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated need to locate the primary tumour)
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S to rule out testicular mass
- MRI of hypothalamic-pituitary region if pituitary adenoma suspected

**Treatment**
- initial observation for most men with gynecomastia
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen has most evidence for benefit
  - aromatase inhibitors: less evidence of benefit as compared to anti-estrogens
- surgical
  - usually required for macromastia, gynecomastia present for >1 yr (fibrosis is unresponsive to medication), or failed medical treatment and for cosmetic purposes

**Pubertal Gynecomastia**
- This benign condition peaks between 13-14 years of age and spontaneously regresses in 90% of cases within 2yr
- Waiting is often the best approach

**Causes of Gynecomastia**
- Drugs
- Other
- Congenital
- Tumour
- Endocrine
- Chronic disease

**Occurrence of Gynecomastia**

Female Reproductive Endocrinology

• see Gynecology, GY23

Paraneoplastic Syndrome

• clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
• triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
• commonly present with cancers of lung, breast, ovaries, or lymphatic system

Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, ESR, CRP, serum/urine electrophoresis
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, PET scan
- ± endoscopy

Treatment

- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: IV Ig, steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

### References
Acronyms

AAA: abdominal aortic aneurysm
ACR: albumin creatinine ratio
AIN: anal intraepithelial neoplasia
AMC: another medical condition
AHI: acute kidney injury
ARB: anagertinsin receptor blockers
BMI: body mass index
BPPV: benign paroxysmal positional vertigo
DRE: double rectal exam
DMPA: depot medroxyprogesterone acid
DHP: dihydropyridine
CRC: colorectal cancer
CHF: congestive heart failure
CF: cystic fibrosis
CCB: complete blood count
CCO: calcium channel blockers
DHEP: Canadian Hypertension Education Program
CHS: creatine kinase
CT: cognitive-behavioural therapy
CHO: congestive heart failure
CPAP: continuous positive airway pressure
CRC: colorectal cancer
CVD: cardiovascular disease
DHP: dihydropyridine
DM/PA: depot medroxyprogesterone
DRE: digital rectal exam
DS: double strength
ED: emergency department
ER: extended release
FRS: Framingham Risk Score
GAB: gastrectomy
GERD: gastroesophageal reflex disease
HC: high-grade squamous intraepithelial lesion
HPV: human papillomavirus
HRT: hormone replacement therapy
ICD: in-hospital death
IGT: impaired glucose tolerance
IU: insulin units
IVP: intravenous pyelogram
KUB: kidneys, ureter, bladder x-ray
LDL-C: low-density lipoprotein cholesterol
LSL: low-grade squamous intraepithelial lesion
LVH: left ventricle hypertrophy
MDI: metered dose inhaler
MAGI: monoamine oxidase inhibitor
MMSE: mini mental status examination
MOCA: Montreal cognitive assessment
MSM: men who have sex with men
MUA: monounsaturated fatty acids
NPH: neutralizing tube defects
NTD: nitroglycerin
OA: ogee and parasites
OCP: oral contraceptive pill
OPD: obsessive-compulsive personality disorder
PHE: periodic health examination
PSA: prostate-specific antigen
PTSD: post-traumatic stress disorder
PUD: peptic ulcer disease
PFA: polymersaturated fatty acids
PVD: peripheral vascular disease
RA: rheumatoid arthritis
RCT: randomized controlled trial
SAH: subarachnoid hemorrhage
SRI: serotonin dopamine reuptake inhibitor
SIDS: sudden infant death syndrome
SLE: systemic lupus erythematosus
SNRI: serotonin norepinephrine reuptake inhibitor
SOB: shortness of breath
SSRI: selective serotonin reuptake inhibitor
TC: total cholesterol
TCA: tricyclic antidepressant
TIA: transient ischaemic attack
TCA: total cholesterol
TCA: tricyclic antidepressant
TIC: triglyceride
TM: tympanic membrane
TMJ: temporomandibular joint
TPU: transurethral incision of the prostate
UC: urogenital colitis
UTI: urinary tract infection
VAIN: vaginal intraepithelial neoplasia
VBI: vulvar intraepithelial neoplasia
WSIB: Workplace Safety and Insurance Board

Four Principles of Family Medicine

College of Family Physicians of Canada Guidelines

1. The family physician is a skilled clinician
   - diagnoses and manages diseases common to the population served
   - recognizes importance of early diagnosis of serious life threatening illnesses

2. Family medicine is a community-based discipline
   - provides information and access to community services
   - responds/adapts to changing needs and circumstances of the community

3. The family physician is a resource to a defined practice population
   - serves as a health resource
   - advocates for public policy to promote health

4. The patient-physician relationship is central to the role of the family physician
   - commits to the person, not just the disease
   - promotes continuity of patient care

Periodic Health Examination

- Canadian Task Force on Preventive Health Care established in 1976, first published in 1979
- mandate: to develop and disseminate clinical practice guidelines for primary and preventive care
- recommendations are based on systematic analysis of scientific evidence
- most notable recommendation is the abolition of the annual physical exam; replaced by the PHE

Purpose of the Periodic Health Examination

- primary prevention: identify risk factors for common diseases; counsel patients to promote healthy behavior
- secondary prevention: presymptomatic detection of disease to allow early treatment and to prevent disease progression
- update clinical data
- enhance patient-physician relationship

Classification of Recommendations (GRADE, 2011)

Strength of Recommendation
- strong: high level of confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
- implies that most individuals will be best served by the recommended course of action
• weak: desirable effects probably outweigh the undesirable effects (weak recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (weak recommendation against an intervention); uncertainty exists
• implies that most people would want the recommended course of action but that many would not
• different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

Quality of Evidence
• high: high level of confidence that true effect lies close to the estimate of the effect
• moderate: true effect likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
• low or very low: true effect may be substantially different from the estimate of the effect

**Choosing Wisely Canada**
http://www.choosingwiselycanada.org/
A campaign to help clinicians and patients engage in conversations about unnecessary tests and treatments and make smart and effective choices to ensure high quality care

**Folic Acid Supplementation in Pregnancy**
(Joint SOGC-Motherisk Clinical Guideline)

- To prevent neural tube defects in all women capable of becoming pregnant
- Low risk women (no personal health risks, planned pregnancy): 0.4-1.0 mg daily folic acid supplementation for at least 2-3 months before conception and throughout pregnancy and postpartum period
- High risk women (health risks including epilepsy, insulin dependent diabetes, BMI >35, family history of NTD, high risk ethnic group): at least 3 mo prior to conception until 10-12 wk post conception: daily supplementation with multivitamins with 5 mg folic acid
- From wk 12 post-conception until postpartum period (4-6 wks or as long as breastfeeding continues): 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no consistent birth control, taking possible teratogenic substances): higher folic acid dose of 5 mg and counselling about prevention of birth defects

**Breast Cancer Screening Guidelines**

2011 Canadian Task Force on Preventive Health Care

- average risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the BRCA1/BRCA2 genes or previous exposures of the chest wall to radiation

Classification of recommendation in brackets. See sidebar on FM2 for classification details. See www.canadiantaskforce.ca – for up-to-date guidelines

Reference: Canadian Task Force on Preventive Health Care, 2014

Family Medicine FM3

Periodic Health Examination

Toronto Notes 2018
Mammography
- age 40-49: routine screening with mammography not recommended (weak recommendation - moderate quality evidence)
- age 50-74: routine screening q2-3yr (age 50-69: weak recommendation; moderate quality evidence, age 70-74: weak recommendation; low quality evidence)
- age 75+: screen if benefits outweigh harm, must take overall health into account

Magnetic Resonance Imaging
- no routine screening with MRI scans (weak recommendation - low quality evidence)

Clinical Breast Examination
- no routine CBE alone or in conjunction with mammography to screen for breast cancer (weak recommendation - low quality evidence)

Breast Self-Examination
- recommend not advising women to routinely practice breast self-examination
- for more information on benign breast lesions and breast cancer, see General Surgery, GS55

Lung Cancer Screening Guidelines
2016 Canadian Task Force on Preventative Health Care
- apply to adults aged 18 and older who are not suspected of having lung cancer
- annual screening with low dose CT for adults aged 55-74 with at least a 30 pack-year smoking history who currently smoke or quit less than 15 years ago, up to three consecutive times

Colorectal Cancer Screening Guidelines
- recommendations for average risk individuals (asymptomatic, no family history of UC, polyps, or CRC)
- average risk testing should begin at age 50, but assessment for risk factors should begin earlier to identify high-risk individuals
  - Canadian Task Force on Preventative Health Care (2016)
    - FOBT (either high sensitivity FOBT or FIT - fecal immunochemical testing) q2yr OR flexible sigmoidoscopy q10yr
    - no colonoscopy as a screening test
    - no screening after age 75 is recommended for average risk patients, but it may be assessed on an individual basis for ages 76-85
- for more information on colorectal neoplasms, see General Surgery, GS33

Figure 1. Approach to higher risk screening
AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children, 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from Can J Gastroenterol 2004;18:93-99. Also see: Colorectal Screening for Cancer Prevention in Asymptomatic Patients, March 2013. Available from http://www.bcguidelines.ca/pdf/colorectal_screening.pdf
Cervical Cancer Screening

- either conventional Papanicolaou (Pap) smear or liquid based cytology testing
  - endocervical and exocervical cell sampling (aim is to sample the transitional zone)
  - best identifies squamous cell abnormalities, less reliable for glandular abnormalities
    - false positives 5-10%, false negatives 10-40% (for single test)
    - false negative rate 50% for existing cervical cancer
- cervical cancer screening guidelines differ by provincial jurisdiction (see The Society of Obstetricians and Gynaecologists of Canada guidelines)

2013 Canadian Task Force for Preventative Care Guidelines

- screen all women age ≥ 25 q3yr (age 25-29: weak recommendation; moderate quality evidence, age 30-69: strong recommendation; high quality evidence)
- women age ≥ 70: if 3 normal tests in a row and no abnormal tests in last 10 yr, can discontinue screening (weak recommendation; low quality evidence)

Ontario guidelines

- screen all women age ≥ 21 who are or have ever been sexually active (includes intercourse or digital/oral activity with partner of either sex)
  - if cytology is normal, can screen every 3 yr
- women age ≥ 70: if 3 successive negative Pap tests in last 10 yr, can discontinue screening
- women who are not sexually active by age 21 should delay cervical cancer screening until sexually active

Pregnant women and women who have sex should follow the routine cervical screening regimen

- women who have had a hysterectomy
  - total: discontinue screening if hysterectomy was for benign disease and no history of cervical dysplasia or HPV infection, continue to swab vaginal vault if history of uterine malignancy/dysplasia
  - subtotal: continue screening according to guidelines

Exceptions to guidelines

- immunocompromised (transplant, steroids, diethylstilbestrol exposure, HIV)
- previously unscreened patients

For more information on cervical cancer (see Gynecology, GY44)

Figure 2. Decision making chart for cervical cancer screening not applicable to adolescents

AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; HSIL = high-grade squamous intraepithelial lesion; LSL = low-grade squamous intraepithelial lesion; TZ = transitional zone

Adapted from: Ontario Cervical Screening Cytology Guidelines, May 2012

Prostate Cancer Screening

2014 Canadian Task Force for Preventative Care Guidelines

- screening for prostate cancer with the prostate specific antigen (PSA) test is not recommended for any age group (age < 55: strong recommendation; low quality evidence, age 55-69: weak recommendation; moderate quality evidence, age > 70: strong recommendation; low quality evidence)
Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- there are several effective ways to promote healthy behavioural change, such as discussions appropriate to a patient's present stage of change
- for more information about motivational interviewing, see www.motivationalinterviewing.org

Motivational Strategies for Behavioural Change

<table>
<thead>
<tr>
<th>Patient’s Stage of Change</th>
<th>Physician’s Aim</th>

Table 2. Motivational Strategies for Behavioural Change

Handy Serving Size Comparisons

- 3 oz meat, fish, poultry → palm of hand
- 1 cup dairy (milk/yogurt) → size of fist
- Bread/grains → one slice, palm of hand
- ½ cup rice/pasta → one hand cupped
- 1 cup of fruit/vegetables → two cupped hands
- 1 tsp oil/butter → tip of thumb
- Nuts/chips/snacks → palm covered

Energy Content of Food

- Carbohydrates 4 kcal/g
- Protein 4 kcal/g
- Fat 9 kcal/g
- Ethanol 7 kcal/g

Calculating Total Daily Energy Expenditure (TDEE)

- Roughly 35 kcal/kg/d
- Varies by age, weight, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

Canadian Cancer Society (CCS) Recommendations for Vitamin D Use

- Based on CCS research on Vitamin D and the prevention of colorectal, breast and prostate cancer
- In consultation with their healthcare provider, the Society recommends that:
  - Adults living in Canada should consider taking Vitamin D supplementation of 1,000 international units (IU) a day during the fall and winter
  - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1,000 IU/d all year round. This includes people: who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
  - Babies who are exclusively breast-fed: 400 IU/d
Cardiovascular Disease Prevention

Table 4. Dietary Guidelines for Reducing Risk of Cardiovascular Disease

<table>
<thead>
<tr>
<th>Recommendations</th>
<th>Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fat, Carbohydrates, Protein</td>
<td>Overall fat intake: 28-27% of total energy Saturated fat: 5-6% of total energy Trans fat: reduce intake, replace with MUFA or PUFA Carbohydrates: 55-55% of total energy Protein: 15-18% of total energy</td>
</tr>
<tr>
<td>Omega-3 Fatty Acid Rich Foods</td>
<td>≥2 servings/wk of fish (especially oily fish like salmon)</td>
</tr>
<tr>
<td>Salt</td>
<td>≤2,400 mg/d</td>
</tr>
<tr>
<td>Alcohol</td>
<td>≤3 drinks/d for men, max 15/wk ≤2 drink/d for women, max 10/wk</td>
</tr>
<tr>
<td>Dietary Approaches</td>
<td>DASH diet (Dietary Approaches to Stop Hypertension), recommended by the American Heart Association (AHA) Diet: high in vegetables/fruits, low-fat dairy, whole grains, poultry, fish, and nuts; Low in sweets, sugar-sweetened beverages, red meats Macronutrients: low in saturated total fat and cholesterol; high in potassium, magnesium, calcium, protein and fibre Mediterranean diet (fruits, vegetables, whole grains, legumes, nuts, olive oil, and herbs)</td>
</tr>
</tbody>
</table>

MUFAs = monounsaturated fatty acids; PUFAs = polyunsaturated fatty acids

</tr>
</tbody>
</table>

Obesity

- see Canadian Task force on Preventive Health Care recommendations (CMAJ February 2015) at: canadiantaskforce.ca/cptphc-guidelines/2015/obesity-adults/
- body mass index (BMI) = weight (kg)/height (m)² = weight (lbs)/height (in)² x 703; BMI is a poor predictor of obesity
- waist circumference (WC) = flexible tape placed on horizontal plane at iliac crest, normal depends on ethnic background
- increased WC for BMI 25-35 increases the risk of cardiovascular disease and type 2 diabetes

Epidemiology

- 25.1% of Canadian adults over 18 (excluding pregnant females) were obese in 2008 and 36.8% were overweight (StatsCan, 2008)
- obesity rate in people of Aboriginal origin was 1.6 times higher than the national average
- proportion of children aged 6-11 who are overweight has more than doubled in the last 25 yr
- percentage of overweight adolescents has tripled
- overweight and obesity rates in children are directly proportional to screen time (see Exercise, FM10)
- only 10-15% of population consume <30% fat daily
- obese persons generally consume more energy-dense food which tends to be highly processed, micronutrient poor, and high in fats, sugars, or starch

Osteoporosis Canada Recommendations for Calcium and Vitamin D Daily Requirements

- Vitamin D: 800-1,000 IU for individuals age <50 yr, 800-2,000 IU for individuals ≥50 yr
- Calcium: 1,000 mg daily from all sources for individuals 19-50 yr and pregnant/lactating women; 1,200 mg daily for individuals >50 yr (recommended to obtain calcium from nutrition whenever possible vs. supplementation)

Effectiveness of Behavioral and Pharmacological Treatment for Overweight and Obesity in Adults

- Purpose: To evaluate the effectiveness of behavioral and pharmacological treatments for overweight and obese adults
- Methods: Review of RCTs of primary-care-relevant behavioral (diet, exercise, lifestyle) and pharmacological (phentermine, methyfentanyl) treatments with or without behavioral interventions in overweight or obese adults with 12 month follow-up from baseline for weight outcomes or harms. Secondary health outcomes (total cholesterol, LDL, fasting blood glucose, incidence of type 2 DM, systolic and diastolic BP) were also studied.
- Results: 50 RCTs were included, and showed that intervention participants had greater weight loss (3.02 kg, 95% CI 2.52-2.52), waist circumference reduction (2.78, 3.34 to 2.22) and body mass index reduction (-1.11, -1.39 to -0.84). Relative risk for weight loss of 5% or greater body weight was 1.77 (1.59 to 1.90), NNT 5, 95% CI (4-7). Incidence of type 2 DM was lower among pre-diabetic intervention participants.
- Conclusion: Behavioral and pharmacological treatments for overweight and obese adults may lead to clinically important reductions in weight and type 2 DM incidence in pre-diabetics.

Eating Disorders

- Anorexia Nervosa
- Bulimia Nervosa
- Binge Eating Disorder

Low BMI Associations

- Osteoporosis
- Gastrointestinal disturbances
- Pain
- Reproductive health

Adverse Medical Consequences of Obesity

- Type 2 DM
- Heart disease
- Stroke
- Sleep apnea
- Gastrointestinal disturbances
- Infections
- Heart failure
- Sleep apnea
- Reproductive health
- Pain
- Mental health
- Cognitive function
- Psychiatric disorders
- Physical activity
- Social function
- Employment status
- Economic productivity
- Quality of life

Obesity and Cardiovascular Disease

- Increased risk of heart disease, stroke, and diabetes
- Increased risk of hypertension, hypercholesterolemia, and hypertriglyceridemia
- Increased risk of cardiovascular disease and type 2 diabetes

Losing Weight

- Aim for caloric intake 500-1000 kcal/d less than total daily energy expenditure (TDEE)
- 3500 kcal energy expended of fat burned, results in 1-2 lb (0.5-1 kg) weight loss per week
- Achieved by combination of increased activity and/ or decreased caloric intake

Low BMI Associations

- Osteoporosis
- Gastrointestinal disturbances
- Pain
- Reproductive health

Pregnancy complications

- Pre-eclampsia
- Gestational diabetes
- Premature labor
- Low birth weight
- Perinatal mortality
- Postpartum depression
- Maternal mortality

Obesity and Pregnancy

- Increased risk of gestational diabetes
- Increased risk of pre-eclampsia
- Increased risk of cesarean delivery
- Increased risk of stillbirth
- Increased risk of infant mortality
- Increased risk of maternal mortality

Pregnancy and Weight

- Maternal weight gain
- Fetal weight gain
- Neonatal weight gain
- Maternal and fetal morbidity
- Maternal and fetal mortality

Hypertension

- Increased risk of hypertension
- Increased risk of stroke
- Increased risk of heart disease
- Increased risk of cardiovascular disease

Sleep Apnea

- Increased risk of sleep apnea
- Increased risk of cardiovascular disease
- Increased risk of stroke
- Increased risk of diabetes

Cancer Risk

- Increased risk of certain types of cancer
- Increased risk of breast cancer
- Increased risk of colon cancer
- Increased risk of prostate cancer
- Increased risk of endometrial cancer

Dyslipidemia

- Increased risk of dyslipidemia
- Increased risk of high cholesterol
- Increased risk of high triglycerides
- Increased risk of low HDL cholesterol

High Blood Pressure

- Increased risk of high blood pressure
- Increased risk of heart disease
- Increased risk of stroke
- Increased risk of kidney disease

Insulin Resistance

- Increased risk of insulin resistance
- Increased risk of type 2 diabetes
- Increased risk of gestational diabetes
- Increased risk of pre-eclampsia

Diabetes Mellitus

- Increased risk of type 2 diabetes
- Increased risk of gestational diabetes
- Increased risk of pre-eclampsia
- Increased risk of stillbirth
- Increased risk of infant mortality
- Increased risk of maternal mortality

Obstructive Sleep Apnea

- Increased risk of obstructive sleep apnea
- Increased risk of cardiovascular disease
- Increased risk of stroke
- Increased risk of diabetes

Osteoarthritis

- Increased risk of osteoarthritis
- Increased risk of knee osteoarthritis
- Increased risk of hip osteoarthritis
- Increased risk of shoulder osteoarthritis

Celiac Disease

- Increased risk of celiac disease
- Increased risk of gluten-sensitive enteropathy
- Increased risk of malabsorption syndrome

Reproductive Health

- Increased risk of infertility
- Increased risk of miscarriage
- Increased risk of preterm birth
- Increased risk of low birth weight
- Increased risk of stillbirth
- Increased risk of neonatal mortality

Cognitive Function

- Decreased cognitive function
- Decreased memory
- Decreased attention
- Decreased executive function

Dementia

- Increased risk of dementia
- Increased risk of Alzheimer’s disease
- Increased risk of vascular dementia
- Increased risk of mild cognitive impairment

Depression

- Increased risk of depression
- Increased risk of anxiety
- Increased risk of suicide
- Increased risk of postpartum depression

Anxiety

- Increased risk of anxiety
- Increased risk of panic disorder
- Increased risk of generalized anxiety disorder
- Increased risk of social anxiety disorder

Mental Health

- Increased risk of mental health problems
- Increased risk of mood disorders
- Increased risk of anxiety disorders
- Increased risk of substance use disorders

Social Function

- Decreased social function
- Decreased social interaction
- Decreased social support
- Decreased quality of life

Employment Status

- Decreased employment status
- Decreased job satisfaction
- Decreased income
- Decreased productivity

Economic Productivity

- Decreased economic productivity
- Decreased work productivity
- Decreased productivity at work
- Decreased income

Quality of Life

- Decreased quality of life
- Decreased physical health
- Decreased mental health
- Decreased overall health
Screening Recommendations
- the CANRISK or FINRISC scores can be used to assess the risk for type 2 DM in overweight and obese patients
- BMI risk assessment should be done every 3-5 yr in people at high risk of developing diabetes within 10 yr

Management

Behavioural/Lifestyle
- weight loss of >5% is clinically significant for reducing many cardiovascular risk factors (e.g., elevated blood pressure, glucose and lipids)
- efficacious behavioural interventions are greater than 12 months duration, include diet and/or exercise and/or lifestyle components, and include group and individual sessions
- structured behavioural and lifestyle interventions should be offered or arranged for overweight individuals BMI >25
- strong recommendation for those with increased risk of Type 2 DM
- BMI >35 and risk factors or BMI >40 are candidates for bariatric surgery failing behavioural modification

Pharmacologic
- the task force recommends against pharmacologic intervention to manage patients who are overweight and obese, although some patients may prefer medications and be good candidates for pharmacologic treatment
- high benefit of behavioural modification alone, NNH (number needed to harm) 10 (mostly GI side effects) for pharmacotherapy

Assess and screen for depression, eating and mood disorders
- Treat comorbidities and other health risks, if present
- Assess readiness to change behaviours and barriers to weight loss

Satisfactory progress or goal achieved?

Yes
- Regular monitoring
  - Assist with weight maintenance
  - Reinforce healthy eating and physical activity advice

No
- Weight maintenance and prevention of weight regain
  - Nutrition therapy
  - Physical activity
  - Cognitive behavioural therapy
  - Address other risk factors: periodic monitoring of weight, BMI and waist circumference q1-2yr
- Pharmacotherapy
  - BMI ≥27 kg/m² + risk factors or BMI ≥30 kg/m²
  - Adjust to lifestyle modifications: consider if patient has not lost 0.5-1 kg (1-2 lb) per wk vb 3-6 mo after lifestyle changes

No
- Bariatric surgery
  - BMI ≥35 kg/m² + risk factors or BMI ≥40 kg/m²
  - Consider if other weight loss attempts have failed. Requires lifelong medical monitoring

IMPORTANT MESSAGE
A modest weight loss of 5-10% of body weight is beneficial. Weight maintenance and prevention of weight regain should be considered as long-term goals

Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children

Adapted from: CMAJ 2007;176:S1-S13

Pharmacotherapy for Obesity
- Orlistat: gastrointestinal lipase inhibitor, reduces fat absorption by 30% by inhibition of pancreatic lipase
- Orlistat is associated with several adverse effects and not approved for clinical use longer than 2 yr
- Orlistat should be avoided in people with inflammatory or chronic bowel disease

Hypertension Signs

Atheroma: plaques in blood vessel walls
- Xanthelasma: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertriglyceridemia induced reddish yellow, pruritic, and painful popular or nodular rash
- Lipemia retinalis: thin atheroma seen in the retinal blood vessels
- Corneal arcus (arcus senilis): lipid deposit in cornea

Hyperlipidemia Signs

Atheroma: plaques in blood vessel walls
- Xanthoma: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertriglyceridemia induced reddish yellow, pruritic, and painful popular or nodular rash
- Lipemia retinalis: thin atheroma seen in the retinal blood vessels
- Corneal arcus (arcus senilis): lipid deposit in cornea

Toronto Notes 2018
**Dyslipidemia**

- see Endocrinology F2

- defined as abnormal elevation of plasma cholesterol or triglyceride levels

### Assessment

**RISK ASSESSMENT, STRATIFICATION AND TREATMENT CONSIDERATION**

Calculate risk (unless statin-indicated condition) using the Framingham Risk Score (FRS) or Cardiovascular Life Expectancy Model (CLEM)

Repeat screening every 5 years for FRS <5% or every year for FRS ≥5%

**Low Risk**

- FRS <10%

**Intermediate Risk**

- FRS 10-19%
- LDL-C ≥3.5 mmol/L or Non-HDL-C ≥4.3 mmol/L or alternative method

**High Risk**

- FRS ≥20%
- LDL-C ≥5 mmol/L
- genetic dyslipidemia

**Clinical atherosclerosis**

- Abdominal aortic aneurysm
- Most diabetes including: Age ≤40yr
- Age ≥60yr and 25 yr duration (type 1 DM)
- Microvascular disease
- Chronic kidney disease

**Discuss Behavioural Modifications**

1. Smoking cessation
2. Diet: adopt a health dietary pattern
3. Exercise: for adults 150 min/wk of moderate-vigorous aerobic activity

Discuss add-on therapy with patient (evaluate reduction in CVD risk vs. additional cost & side effects)

**Monitor Response to statin Rx**

- 1st line: Ezetimibe (BAS as alternative)
- 2nd line: PCSK9 inhibitors (add-on to other drugs)

1. Target achieved on maximally tolerated dose?

   - YES
   - NO

   **ADD-ON**

- LDL-C <2.0 mmol/L or >50% reduction or apoB <0.8 g/L or non-HDL-C <2/6 mmol/L
- LDL-C >50% reduction

To calculate Framingham Risk Score, go to http://www.framinghamheartstudy.org/risk-functions/cardiovascular-disease/10-year-risk.php#

### Risk Factors for Screening for Dyslipidemia

- First Nations or South Asian ancestry
- Current cigarette smoking
- Diabetes
- Arterial Hypertension
- Family history of premature CVD
- Family history of hyperlipidemia
- Erectile dysfunction
- Chronic kidney disease
- Inflammatory disease (lupus, rheumatoid arthritis, psoriatic arthritis, IBD)
- HIV infection
- Chronic obstructive pulmonary disease
- Clinical evidence of atherosclerosis or abdominal aneurysm
- Clinical manifestation of hyperlipidemia
- Obesity (BMI ⇒ 27)

### Non-fasting Lipids vs. Fasting Lipids

Non-fasting (TC and non-HDL cholesterol) can be used for Framingham Risk Assessment and hold same prognostic value as fasting lipids. In fasted vs. non-fasted samples, Non-HDL and TC varies by 2%, LDL-C by 10% and TG by 20%

Recently, non-fasting LDL-C has the same prognostic value as fasting LDL-C. Ontario Association of Medical Laboratories Guidelines for Lipid Testing in Adults (2013): http://www.oaml.com/documents/4kref/Adultlipidtest- ingFinal2013_000.pdf

**Safety of Statins: An Update**

Therapeutic Advances in Drug Safety 2012;3:133-144

Trials have shown that statin therapy slightly increases the incidence of diabetes; however, the absolute risk is small. Relative to the reduction in coronary events, the clinical significance is not great enough to recommend against their use.

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations (potential increased risk of myopathy and rhabdomyolysis).

### Figure 5. Target lipid values for primary prevention of CAD (2012 Canadian Cholesterol Guidelines)

- measure fasting serum TC, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males >40 yr and females >50 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see sidebar)
- screen for secondary causes: hypothyroidism, chronic kidney disease, DM, nephrotic syndrome, liver disease
- risk category
  - estimate using the model for 10 yr CAD risk developed from the Framingham data (Framingham Risk Score – FRS)
  - FRS calculated based on the following factors: gender, age, HDL-C, total cholesterol, sBP, smoking, DM
  - family history of CVD <55 male relative or <65 in female relative doubles FRS
  - to be completed for men age 40-75, and women age 50-75 q3-5yr
  - cardiovascular age calculated as patient’s age ± the difference between his or her estimated remaining life expectancy
  - used to increase adherence to therapy and reaffirm positive effect of following therapy
  - treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C (not used widely yet)
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apo B >1.2 g/L or non-HDL-C >4.3 mmol/L
  - other targets include: TCHDL-C ratio, apo B/apo A1 ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels
Management

- intensity and type of treatment is guided by “risk category” assigned (see Figure 5)
- 1. health behaviours (can decrease LDL-C by up to 10%)
  - smoking cessation: probably the most important for preventing CAD
  - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
  - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk
  - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patients should start treatment immediately with concurrent health behaviour interventions
- for a comparison of dyslipidemia medications, see Endocrinology, E50
- 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
  - risks: myopathy and hepatotoxicity
  - if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
  - post-acute coronary syndrome, cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high risk individuals
  - lower evidence for other agents: bile acid sequestrants nicotinic acid, fibrates, psyllium
  - monitoring
    - ALT, CK, creatinine at baseline then 6 wk later for signs of transaminitis or myosit; tolerate rise in CK up to 10 times upper limit of normal vs 2-3 times if symptomatic, or serum creatinine rise of ≤25%
    - no routine repeated measures of ALT and CK necessary in asymptomatic patients using statin therapy
    - if adequate response is achieved, evaluate fasting lipids q6-12mo

Isolated Hypertriglyceridemia

- does not increase cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild ≥2.2 mmol/L (≥200 mg/dL); marked ≥5.6 mmol/L (≥100 mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics, increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically >10 mmol/L) is associated with an increased risk of acute pancreatitis
- drug therapy (used to prevent pancreatitis, NOT cardiovascular disease!)
  - nicotinic acid
  - fibrates

Exercise

Table 6. Canadian Physical Activity and Sedentary Behaviour Guidelines (2012 CSEP Guidelines)

<table>

</tbody>
</table>
Epidemiology
- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary

Management
- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 DM, osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, and mental health (morale and self-esteem)

Smoking Cessation

Epidemiology
- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2012 Canadian data from the Canadian Tobacco Use Monitoring Survey (CTUMS) on population age ≥15
  - 16% are current smokers (lowest since 1965)
  - highest prevalence in age group 20-24 (20%)
  - 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing

Management
- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts and results
  - CAN-ADAPPT 2012 guidelines
    - tobacco use status should be updated for all patients regularly (Grade 1A)
    - health care providers should clearly advise patients to quit (Grade 1C)
    - health care providers should also monitor the patient's mental health status/other addictions while quitting smoking. Medication dosage should be monitored and adjusted as necessary (Grade 1A)
  - every smoker should be offered treatment
    - combining counselling and smoking cessation medication is more effective than either alone (Grade 1A)
    - make patient aware of withdrawal symptoms
      - low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
    - ≥4 counselling sessions > 10 min each with 6-12 mo follow-up yields better results
    - 14% abstinent with counselling vs. 10% without counselling
    - approach depends on patient's stage of change (see Motivational Strategies for Behavioural Change, FM6)
  - willing to quit
    - provision of social support, community resources (self-help, group, helpline, web-based strategies)
    - pregnant patients: counselling is recommended as 1st line treatment (Grade 1A). Nicotine replacement therapy (NRT) should be made available to pregnant women who are unable to quit using non-pharmacologic methods; intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch (Grade 1C).
    - Use bupropion (no evidence of fetal or reproductive harm) only if benefits > risks; consult Motherisk. Varenicline has not been studied in pregnancy and should no be used in pregnant women
    - pharmacologic therapy
      1. Nicotine Replacement Therapy
        - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
        - no difference in achieving abstinence for different forms of NRT
        - reduces craving and withdrawal symptoms without other harmful substances that are contained in cigarettes
      - use with caution: immediately post-MI, serious/worsening angina, serious arrhythmia
      - advise NO smoking while using NRT
    2. Antidepressants (note: mode of action appears to be independent of antidepressant effect)
      - Bupropion SR (Zyban+)
        - 21% abstinent at 12 mo vs. 8% for placebo
        - no advantage for NRT vs. bupropion (similarly effective)
      - Varenicline (Champix)
        - partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
        - more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% for bupropion vs. 9% with placebo)
        - significant side effects may lower patient compliance

Conclusion
- simple advice can increase cessation rates by 13%. More intensive advice and providing follow-up support may further increase quit rates.
Table 7. Types of Nicotine Replacement Therapy

<td>Partial nicotinic receptor agonist, and partial nicotinic receptor competitive antagonist</td>
<td>1. 0.5 mg qAM x 3 d 2. Then 0.5 mg bid x 4 d 3. Continue 1 mg bid x 12 wk to additional 12 wk as maintenance</td>
<td>1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop</td>
<td>Caution with pre-existing psychiatric condition</td>
</tr>
</tbody>
</table>

*Bupropion and Varenicline may be used in combination with nicotine replacement therapy

- unwilling to quit
  - motivational intervention (5 Rs)
    1. Relevance to patient
      - relevant to patient’s disease status or risk, family or social situation (e.g., having children in the home), health concerns, age, gender
    2. Risks of smoking
      - short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
      - long-term: MI, stroke, COPD, lung CA, other cancers
    3. Rewards: benefits
      - improved health, save money, food tastes better, good example to children
    4. Roadblocks: obstacles
      - fear of withdrawal, weight gain, failure, lack of support
    5. Repetition
      - reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)

- recent quitter
  - highest relapse rate within 3 mo of quitting
  - minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
  - prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

Alcohol

- see Psychiatry, PS23

Definition

- diagnostic categories occur along a continuum

Epidemiology

- 10-15% of patients in family practice are problem drinkers
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women or elderly, patients with high socioeconomic status

- one standard drink = 14 g of pure alcohol
- Beer (5% alcohol) = 12 oz
- Wine (12-17% alcohol) = 5 oz
- Fortified wine = 3 oz
- Hard liquor (40%) = 1.5 oz
Assessment
- screen for alcohol dependence with CAGE questionnaire
  - if CAGE positive, explore with further questions for alcohol abuse/dependence
- assess drinking profile
  - setting, time, place, occasion, with whom
  - impact on: family, work, social
  - quantity-frequency history
    - how many drinks per day?
    - how many days per week?
    - maximum number of drinks on any one day in the past month?
- if identified positive for alcohol problem
  - screen for other drug use
  - identify medical/psychiatric complications
  - ask about drinking and driving
  - ask about past recovery attempts and current readiness for change

Investigations
- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

Management
- intervention should be consistent with patient’s motivation for change
- individualized counselling and regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-step program
- outpatient/day programs for those with chronic, resistant problems
- family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
- in-patient program if:
  - dangerous or highly unstable home environment
  - severe medical/psychiatric problem
  - addiction to drug that may require in-patient detoxification
  - refractory to other treatment programs
- pharmacologic
  - diazepam for withdrawal
  - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  - naltrexone: competitive opioid antagonist that reduces craving and pleasurable effects of drinking
  - may trigger withdrawal in opioid-dependent patients
  - acamprosate: glutamate receptor modulator that also reduces craving
- see Psychiatry, PS23

Prognosis
- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of abusers exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

Common Presenting Problems

Abdominal Pain
- see Gastroenterology, G11 and General Surgery, GS4

Epidemiology
- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

Etiology
- most common diagnosis in family medicine at 28% is “nonspecific abdominal pain,” which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticulitis, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

Some Adverse Medical Consequences of Problem Drinking
- GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/ esophageal cancer
- Cardiac: HTN, alcoholic cardiomyopathy
- Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
- Hematologic: anemia, coagulopathies
- Other: trauma, insomnia family violence, anxiety/depression, social/ family dysfunction, sexual dysfunction, fetal damage

Figure 6. Continuum of alcohol use

Common Presenting Problems

Abdominal Pain

Epidemiology

Etiology
- most common diagnosis in family medicine at 28% is “nonspecific abdominal pain,” which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticulitis, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

Some Adverse Medical Consequences of Problem Drinking
- GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/ esophageal cancer
- Cardiac: HTN, alcoholic cardiomyopathy
- Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
- Hematologic: anemia, coagulopathies
- Other: trauma, insomnia family violence, anxiety/depression, social/ family dysfunction, sexual dysfunction, fetal damage

Figure 6. Continuum of alcohol use
Pathophysiology

- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain

- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
  - RUQ: biliary, hepatic, colonic, pulmonary, renal
  - LUQ: cardiac, gastric, pancreatic, renal, vascular
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon
  - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region
  - any location: aneurism, dissection, ischemia, zoster, muscle strain, hernia, bowel obstruction, ischemia, peritonitis, porphyria, DKA

Investigations

- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, toxicology screen, β-hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - ultrasound (renal stones, gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT scan (AAA, appendicitis), non-contrast helical CT-Scan (first choice for renal stones)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - H. pylori testing (urea breath test, serology, biopsy)

Allergic Rhinitis

- see Otolaryngology, OT23

Definition

- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification
  - seasonal
    - symptoms during a specific time of the year
    - common allergens: trees, grass and weed pollens, airborne moulds
  - perennial
    - symptoms throughout the year with variation in severity
    - common allergens: dust mites, animal dander, moulds
- persistent allergic rhinitis may lead to chronic rhinosinusitis

Etiology

- increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

Epidemiology

- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, eczema, sinusitis, and otitis media

Assessment

- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

Management

- conservative
  - minimize exposure to allergens
  - most important aspect of management, often sufficient (may take months)
  - maintain hygiene, saline nasal rinses
- pharmacologic agents
  - oral antihistamines – first line therapy for mild symptoms
    - e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  - intranasal corticosteroids for moderate/severe or persistent symptoms (≥1 mo of consistent use to see results)
  - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)

Abdominal Pain Red Flags

- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings
- New onset pain, change in pain, or altered bowel habits in elderly
- Weight loss
- Blood per rectum/melena
- Anemia
- Supraclavicular nodes
- Family history of serious bowel disease

In patients >50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis

Differential Diagnosis

- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

Rhinitis Medicamentosa

Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect
Common Presenting Problems

- allergy skin testing
  - for patients with chronic rhinitis
  - symptoms not controlled by allergen avoidance, pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

## Amenorrhea

- see Gynecology, GY10

## Anxiety

- see Psychiatry, PS13

### Epidemiology

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

### Screening

- screening tools such as the GAD-7 tool
- screening questions
  - Do you tend to be an anxious or nervous person?
  - Have you felt unusually worried about things recently?
  - Has this worrying affected your life? How?

### Assessment

- associated symptoms
- risk factors
  - family history of anxiety or depression, past history of anxiety, stressful life event, social isolation, female, comorbid psychiatric diagnosis (e.g. depression)
  - assess substance abuse, comorbid depression, stressful life events, trauma, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms (panic attacks, specific situations/stressors, excessive worry about common concerns, repetitive thoughts and/or behaviours to neutralize the anxiety) and their duration
- Generalized Anxiety Disorder 7–item (GAD – 7) scale to assess level of anxiety

![Symptoms of Anxiety](image)

**Symptoms of Anxiety**

Are the symptoms predominantly...

- In the form of panic with physical (autonomic) symptoms?
- Secondary to a specific experienced trauma?
- Recurrent anxious thoughts?

- Do the panic attacks come...
  - With a specific situation
  - "Out of the blue"

- Is patient avoiding situation?
  - Yes
  - No

- Patient afraid of another attack and its implications
- Are they accompanied by a repetitive behaviour meant to neutralize the anxiety?
- Are the thoughts intrusive, inappropriate and distressing?

- Specific trigger (e.g. flying, spiders, blood, etc.)
- Public setting where there might be negative evaluation
- Setting where it may be difficult to escape

**Specific Phobia**

**Social Phobia**

**Panic Disorder with Agoraphobia**

**Adjustment Disorder**

**GAD**

**PTSD**

**OCD**

**Rule Out**

- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatofrom disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

**Differential Diagnosis of Anxiety Disorders**

- Panic disorder
- GAD
- Social Anxiety Disorder (previously Social Phobia)
- Agoraphobia
- Specific phobia
- Selective Mutism
- Separation Anxiety Disorder
- Other: GMC, AMC, mood disorder, psychotic disorder, OCD

**Excessive worry and apprehension about social situations?**

Figure 7. Differentiating anxiety disorders

Management
- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- lifestyle advice: decrease caffeine and alcohol intake, exercise, relaxation techniques, mindfulness strategies
- self help materials, community resources (e.g. support groups)
- CBT, cognitive interventions, exposure therapy etc
- treat any underlying medical and/or comorbid conditions
- provide support to family and caregivers
- for pharmacotherapy, see Psychiatry, PS48

Asthma/COPD

Definition
- asthma
  - chronic, reversible airway inflammation characterized by periodic attacks of wheezing, SOB, chest tightness and coughing
  - airways hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucus plugs and increased inflammation
  - cannot be diagnosed at first presentation; called reactive airway disease until recurrent presentations
  - pulmonary function tests (PFTs) can be done from age 6 or when child able to follow instructions to do PFTs
  - peak flow meters are useful in the office and at home for monitoring
- chronic obstructive pulmonary disease (COPD)
  - group of chronic, progressive, non-reversible diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms

Table 9. Differentiating COPD from Asthma

<table>
<thead>
<tr>
<th>COPD</th>
<th>Asthma</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Age of Onset</strong></td>
<td>Usually in 6th decade</td>
</tr>
<tr>
<td><strong>Role of Smoking</strong></td>
<td>&gt;10 pack yr</td>
</tr>
<tr>
<td><strong>Reversibility of Airflow Obstruction</strong></td>
<td>Airflow obstruction is chronic and persistent</td>
</tr>
<tr>
<td><strong>Evolution</strong></td>
<td>Slow, progressive worsening (with periodic exacerbations)</td>
</tr>
<tr>
<td><strong>History of Allergy</strong></td>
<td>Infrequent</td>
</tr>
<tr>
<td><strong>Precipitators</strong></td>
<td>Environmental irritants (air pollution), cigarette smoking, α-antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs)</td>

<td></td>
<td>Increased bronchial markings (chronic bronchitis) and hyperinflation (emphysema) often co-exist, bullae</td>
</tr>
</tbody>
</table>

Management
- **Mild**
  - Step 1: SABA pm (salbutamol)
  - Step 2: SABA pm + LAAC (i.e. tiotropium) or LABA (e.g. salmeterol)
  - **Moderate**
    - Step 3: SABA pm + LAAC + low-dose combined ICS/LABA; consider inhaled vs. oral steroids
  - **Severe**
    - Step 4: 2-agonist + ICS
      - Pneumococcal vaccination, annual influenza immunization

**Advanced**
- Ongoing patient education, and environmental control SABA taken pm as rescue medication + maintenance meds
- Maintenance medications
  - Step 1: Low-dose ICS
  - Step 2: Medium/high dose ICS or low-dose ICS plus e ther LABA, LT modifier, or long-acting theophylline
  - Step 3: Medium/high dose ICS plus either LABA, LT modifier, or long-acting theophylline
  - Step 4: As above plus immunotherapy ± oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization

ICS = inhaled corticosteroids; LAAC = long-acting anticholinergic; LABA = long-acting β-agonist; LT modifier = leukotriene modifier; SABA = short-acting β-agonist

Figure 8. Expiratory flow volume curves (obstructive, normal, and restrictive disease)

See Respirology, R7

Signs of Poorly Controlled Asthma
- ≥3 β2 agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk.

</tr>
<tr>
<td>Ipratropium/Albuterol – Combivent®</td>
<td>clear/orange</td>
</tr>
</tbody>
</table>

Anticholinergics
- Ipratropium – Atrovent®: clear/green
- Olodaterol – Alupent®: white/teal
- tiotropium – Spiriva®: white/turquoise

More About Inhalers
- • Aerosols (puffers = MDI, MDI + spacer) MDIs should be used with spacers to:
  - Reduce side effects
  - Improve amount inhaled
  - Improve efficiency of use
- • Dry Powder Inhalers (discus, turbuhaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
- • Nebulizers can be used to convert liquid medications into a fine mist; recommended for use if contraindications to MDIs

Differential Diagnosis of Wheezing
- • Allergies, anaphylaxis
- • Asthma, reactive airway disease
- • GERD
- • Infections (bronchitis, pneumonia)
- • Obstructive Sleep Apnea
- • COPD
- • Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of hypokalemia: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, N/V, polyuria

FM16 Family Medicine
Common Presenting Problems
Toronto Notes 2018
Benign Prostatic Hyperplasia

Definition
- hyperplasia of the stroma and epithelium in the periurethral transition zone

History and Physical
- include current/past health, surgeries, trauma, and current and OTC meds
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

Investigations
- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue
  - values
    - <4.0 ng/mL: normal, but must take into account patient's age and velocity of PSA increase
    - 4-10 ng/mL: consider measuring free/total PSA
    - >10 ng/mL: high likelihood of prostate pathology
- PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
- increased PSA in a younger man is more often due to cancer than other causes
- abnormal DRE or PSA should trigger further assessment
- decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
- other tests
  - Cr, BUN
  - post-void residual volume by ultrasound
  - urodynamic studies, renal ultrasound
  - patient voiding diary
- tests NOT recommended as part of routine initial evaluation include:
  - cystoscopy
  - cytology
  - prostate ultrasound or biopsy
  - IVP
  - urodynamic studies

<table>
<thead>
<tr>
<th>Table 10. Symptoms and Complications of BPH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Obstructive Symptoms</td>
</tr>
<tr>
<td>-----------------------</td>
</tr>
<tr>
<td>Hesitancy (difficulty starting urine flow)</td>
</tr>
<tr>
<td>Diminution in size and force of urinary stream</td>
</tr>
<tr>
<td>Stream interruption (double voiding)</td>
</tr>
<tr>
<td>Urinary retention (bladder does not feel completely empty)</td>
</tr>
<tr>
<td>Post-void dribbling</td>
</tr>
<tr>
<td>Overflow incontinence</td>
</tr>
<tr>
<td>Nocturia</td>
</tr>
</tbody>
</table>

Management
- referral to urologist if moderate/severe symptoms
- conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  - fluid restriction (avoid alcohol and caffeine)
  - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  - pelvic floor/Kegel exercises
  - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
  - α-receptor antagonists (e.g. terazosin [Hytrin®], doxazosin [Cardura®], tamsulosin [Flomax®], alfuzosin [Xatral®])
  - relaxation of smooth muscle around the prostate and bladder neck
  - 5α reductase inhibitor (e.g. finasteride [Proscar®])
  - only for patients with demonstrated prostatic enlargement due to BPH
  - inhibits enzyme responsible for conversion of testosterone into dihydrotestosterone (DHT) thus reducing growth of prostate
  - phytotherapy (e.g. saw palmetto berry extract, Pygeum africanum)
  - more studies required before this can be recommended as standard therapy (considered safe)
- surgical
  - TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostates <30 g)
  - absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  - complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

Differential Diagnosis
- Prostate cancer
- Urethral obstruction
- Bladder neck obstruction
- Neurogenic bladder
- Overactive bladder
- Cystitis
- Prostatitis

Self-Management Asthma and COPD
Education and Written Action Plan
- Education is a key component in management of asthma and COPD
- Guided self-management combining education, regular medical review, self-assessment, and written action plan have been shown to reduce hospitalizations, ER visits, and missed days at work or school.
- Sample action plans available online: http://www.respiratoryguidelines.ca
### Bronchitis (Acute)

**Definition**
- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

**Epidemiology**
- 5th most common diagnosis in family medicine, most common is URTI

**Etiology**
- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, respiratory syncytial virus (RSV)
- 20% bacterial: *M. pneumoniiae, C. pneumoniiae, S. pneumoniiae*

**Investigations**
- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not useful
- CXR if suspect pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or CHF
- PFT with methacholine challenge if suspect asthma

**Management**
- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic
  - (see Antimicrobial Quick Reference, FM49)
  - antibiotics in children show no benefit

### Chest Pain

- see Cardiology and Cardiac Surgery, C4 and Emergency Medicine, ER11

*Adapted from: McClenachy J, Rupal S. Outpatient diagnosis of acute chest pain in adults. Am Fm Physicians. 2013 Feb 1; 87(3): 177-182*
Common Cold (Acute Rhinitis)

- Definition: viral URI with inflammation

Epidemiology
- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms:
  - mainly rhinoviruses (30-35% of all colds)
  - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

Risk Factors
- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

Clinical Features
- symptoms:
  - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
  - general: malaise, headache, myalgias, mild fever
- signs:
  - erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
- complications:
  - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
  - asthma/COPD exacerbation

Differential Diagnosis
- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

Management
- patient education:
  - symptoms peak at 1-3 d and usually subside within 1 wk
  - cough may persist for days to weeks after other symptoms disappear
  - no antibiotics indicated because of viral etiology
  - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention:
  - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
  - yearly influenza vaccination
- symptomatic relief:
  - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
  - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye's syndrome)
  - cough suppression: dextromethorphan or codeine if necessary (children under 6 yr of age should not use any cough/cold medications)
- decongestants, antihistamines
- patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

Infections
- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests [LFTs], etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

Management of Common Causes of Chest Pain
- angina/ischemic heart disease
  - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ED
  - myocardial infarction
    - ASA (160-325 mg, chewed stat), clopidogrel (Plavix®), LMWH (enoxaparin), morphine, oxygen, NTG
    - ± reperfusion therapy with fibrinolytics (e.g. tPA, RPA, TNK, or SK) if within 12 h (ideally <30 min)
  - percutaneous intervention (cath lab) if <90 min
  - start β-blocker (e.g. metoprolol starting dose 25 mg PO q6h or bid, titrating to HR goal of 55-60 bpm)
  - endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
  - GERD: antacids, H2-blockers, PPIs, patient education
  - costochondritis: NSAIDs

Echinacea for Preventing and Treating the Common Cold
(Cochrane Database Syst Rev 2014;2:CD000530)

Purpose: To assess whether Echinacea preparations are effective and safe for the prevention and treatment of the common cold.

Methods: Meta-analysis of RCTs comparing mono-preparations of Echinacea with placebo. Primary efficacy outcome was number of individuals with at least one cold in prevention trials, and duration of colds in treatment trials. Primary safety and acceptability outcome was number of participants dropping out due to adverse events.

Results: 24 double-blind trials with 4,631 participants were included. No prevention study comparisons comparing Echinacea and placebo found a statistically significant difference in terms of number of patients with at least one cold episode, though a relative risk reduction of 10% to 25% was identified. Of treatment trials reporting on duration of colds, only 1 study of 7 showed a significant effect favouring Echinacea over placebo. No significant differences were found between Echinacea and placebo groups in number of drops due to adverse events, though prevention trials showed a trend towards higher drop-out numbers due to adverse events in treatment groups.

Conclusions: Echinacea products have not been shown to provide benefits for treating colds, although it is possible there is a weak benefit from some Echinacea products. Individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.
Concussion/Mild Traumatic Brain Injury

- see Neurosurgery, NS30, and Emergency Medicine, ER9
- a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 3rd edition (SCAT3), Br J Sports Med 2013 47: 259

Contraception

- see Gynecology, GY17

EMERGENCY CONTRACEPTION

- hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital copper IUD insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- copper IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

Cough

History and Physical

- duration (chronic - 8 wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI, β-blockers), allergies
- PMH: lung (asthma, COPD, CF), heart (CHF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O2 saturation, respiratory exam, HEENT and precordial exam

Investigations

- guided by findings on history and physical
  - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

Dementia (Major Neurocognitive Disorder)

- see Psychiatry, PS20

Epidemiology

- 15% of Canadians ≥65 yr are living with dementia; risk for dementia doubles every 5 years after age 65
- prevalence of depression in dementia is 20-60%; major depression decreases as dementia severity increases; vascular and mixed dementias have a higher prevalence of depression
- leading causes: Alzheimer’s dementia (40-50%), Mixed dementia (20-25%), Lewy-Body dementia (5-15%), Vascular dementia (5-10%), Frontotemporal dementia (5-10%)

Investigations

- history, physical exam, MMSE, MOCA (best screening test), dementia quick screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B12, folate, VDRL, HIV, head CT

Management

- treat and prevent reversible causes
  - provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
  - family education, counselling, and support (respite programs, group homes)
  - pharmacologic therapy: NMDA receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose neuroleptics and antidepressants can be used to treat behavioural and emotional symptoms
  - 20% of patients develop clinical depression, most commonly seen in vascular dementia

Dementia Quick Screen = Mini Cog + Animal Naming

- 3 simple tests, takes about 2 min
- Use when suspect mild cognitive impairment or when patient is at high risk
- Mini Cog = 3-word recall + clock drawing
- Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/hand placing or only minor spacing problems)
  - 0 word recall = impairment, 1-2 words and clock drawing abnormal = impairment, 3-word recall = normal
- Naming animals in 1 min (normal = >15 in one min)
- Interpretation: If all 3 results within normal range, cognitive impairment unlikely
- Return for further evaluation if:
  - <15 animals named
  - 0.1 words recalled
  - Clock Drawing Abnormal
**Depression**

- see Psychiatry, PS10

**Etiology**
- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of patients may not receive appropriate treatment for their depression
- early diagnosis and treatment improve outcomes

**Screening Questions**
- Canadian Task Force on Preventive Health Care (2103) recommends not routinely screening for depression
- high-yield screening questions are:
  - "Are you depressed?" (high specificity and sensitivity)
  - "Have you lost interest or pleasure in the things you usually like to do?" (anhedonia)
  - "Do you have problems sleeping?"
- PHQ9 tool is useful to screen, diagnose and monitor depression; use Geriatric Depression Scale (GDS) for the geriatric population

**Assessment**
- risk factors: see Psychiatry, PS10
- personal or family history of depression
- medications and potential substance abuse problems
- high risk for suicide/homicide
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood ≥2 wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck’s Depression Inventory, Zung’s self-rating depression scale, Children’s Depression Inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B12, electrolytes, urinalysis, glucose, etc.)

**Treatment**
- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
  - treatment options are pharmacotherapy, psychotherapy, or a combination of both
  - combination therapy is synergistic and most effective (refer to EBM in sidebar)
  - treatment of youth (age 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
  - monitor closely for adverse effects such as suicidal ideation and behaviour
  - psychotherapy
    - CBT or interpersonal therapy (IPT) alone can be used for mild depression
    - psychotherapy plus medication is recommended for moderate to severe depression
  - treatment should continue for at least 6 months
  - ongoing management should include assessment in key domains (school, home, social setting)
  - reassessment and referral recommended if no improvement after 6-8 wk of treatment
  - for adolescents with moderate/severe depression and coexisting psychosis and/or substance abuse, consider referral

**Table 12: Common Medications**

<table>
<thead>
<tr>
<th>Class</th>
<th>Examples</th>
<th>Action</th>
<th>Side Effects</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSRI</td>
<td>paroxetine (Paxil®), fluoxetine (Prozac®), sertraline (Zoloft®), citalopram (Celexa®), fluvoxamine (Luvox®), escitalopram (Cipralex®)</td>
<td>Block serotonin reuptake</td>
<td>Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested)</td>
<td>First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial)</td>
</tr>
<tr>
<td>SNRI</td>
<td>venlafaxine (Effexor®), duloxetine (Cymbalta®)</td>
<td>Block serotonin and NE reuptake</td>
<td>Insomnia, tremors, tachycardia, sweating</td>
<td>Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication</td>
</tr>
<tr>

**Conclusion**

Combination pharmacotherapy and psychological treatment for depression: A systematic review

**Purpose:** To examine the relationship between adherence and efficacy of antidepressant medications plus psychological treatment versus medications alone in the management of depressive disorders.

**Methods:** Systematic review of RCTs comparing antidepressant medications alone versus combination therapy with psychological intervention included. Efficacy and adherence to therapy were the main outcomes.

**Results:** 16 trials with 3,182 patients were included.

Patients receiving combination therapy showed significantly greater improvements than those receiving medications alone (OR 1.86, 95% CI 1.30-2.64); dropout and non-responder proportions did not differ in distribution between the two groups (OR 0.36, 0.13-1.20).

A significant advantage with combination therapy was noted in studies with follow-up longer than 12 weeks (OR 2.11, 1.20-3.63), accompanied by significant reduction in dropout and non-responder proportions.

**Conclusions:** Combination therapy with psychological treatment and medication is associated with greater improvement rates than medication alone, and may decrease dropout rates with longer therapies.
Prognosis
- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

Diabetes Mellitus

Definition
- metabolic disorder characterized by the presence of hyperglycemia due to defective insulin secretion, defective insulin action or both

Classification and Diagnosis
- see Endocrinology

Epidemiology
- major health concern, affecting up to 10% of Canadians
- incidence of type 2 DM is rising due to increasing obesity, sedentary lifestyle, and age of the population
- Canadian adults with DM are twice as likely to die prematurely, compared to persons without DM

Risk Factors
- type 1 DM
  - personal or family history of autoimmune disease
- type 2 DM
  - first degree relative with DM
  - age ≥40 yr
  - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  - prior GDM, macrosomic baby (>4 kg)
  - PCOS
  - history of IGT or IFG
  - presence of complications associated with DM
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
- both
  - member of a high risk population (e.g. Aboriginal, Hispanic, Asian, or African descent)

Screening
- type 2 DM
  - FBG in everyone ≥40 q3yr, or at high risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of ≥1 risk factor (see above)
- GDM (see Obstetrics, OB26)
  - all pregnant women between 24-28 wk gestation

Goals of Therapy
- see Endocrinology and side bar (SMART Goals)

DM Related Symptoms
- Hyperglycemia: polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections
- Diabetic Ketoacidosis (DKA): fruity breath, anorexia, N/V, fatigue, abdominal pain, Kussmaul breathing, dehydration
- Hypoglycemia: hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma

Long-Term Complications of DM
- Microvascular: nephropathy, retinopathy, neuropathy
- Macrovascular: CAD, CVD, PVD

Smart Goals
- Diabetes Quick Reference Guide
  - A1C: Optimal Glycemic Control (Usually <7%)

## Nonpharmacologic Management

- **diet**
  - all diabetics should see a registered dietician for nutrition counselling
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic-index foods, ensure regularity in timing and spacing of meals
- **physical activity and exercise**
  - at least 150 min of aerobic exercise per wk, plus 2 sessions per wk of resistance exercise is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if insulin treated, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

## Self-Monitoring of Blood Glucose

- **type 1 DM**: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- **type 2 DM**: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2013 Canadian Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

## Calculate Total Insulin Required

- **type 1 DM**: 0.5-0.7 units/kg/d
- **type 2 DM**: 0.3 units/kg/d

## Dietary Advice for Treatment of Type 2 DM in Adults

- **Purpose**: To assess the effects of type and frequency of different dietary advice strategies for adults with type 2 diabetes.
- **Methods**: Systematic review of RCTs with follow-up of 6 mo or longer, where dietary advice was the main intervention.
- **Results**: 36 RCTs with 1,467 participants were included, all measuring weight and glycemic control measures, and some reporting mortality, blood pressure, serum cholesterol and triglycerides, maximal exercise capacity and compliance. No data was available for efficacy of dietary advice in terms of dietary changes. Adoption of regular exercise was found to promote HbA1C glycemic control in type 2 diabetic patients.
- **Conclusion**: No high-quality data is available for the efficacy of dietary treatment of type 2 diabetes, though exercise has been shown to improve HbA1C at 6 and 12 mo follow-up in patients.
Common Presenting Problems

</table>

**Figure 10. Management of hyperglycemia in type 2 diabetes**

**At diagnosis of Type 2 DM**

- **Start lifestyle intervention (nutrition therapy and physical activity) ± Metformin**

  - **A1C < 8.5%**
  - **A1C ≥ 8.5%**
  - **Symptomatic hyperglycemia with metabolic decompensation**

  **If not at glycemic target (2-3 mo)**
  - **Start or increase metformin**

  **If not at glycemic targets**
  - **Initiate insulin ± metformin**

**Add another agent best suited by prioritizing patient characteristics:**

**PATIENT CHARACTERISTIC**

- Degree of hyperglycemia
- Risk of hypoglycemia
- Overweight or obesity
- Cardiovascular disease
- Comorbidities (renal, CHF, hepatic)
- Preferences and access to treatment

**CHOICE OF AGENT**

- SGLT2 inhibitor with demonstrated CV outcome benefit

**Add another class of agent best suited to the individual (classes listed in alphabetical order):**

**Note:** Physicians should refer to the most recent edition of the Compendium of Pharmaceuticals and Specialties (Canadian Pharmacists Association, Ottawa, Ontario, Canada) for product monographs and for detailed prescribing information.

**Add another agent from a different class; add or intensify insulin regimen**

**Make timely adjustments to attain target A1C within 3-6 mo**

**Figure 11. Management of hyperglycemia in type 2 diabetes**

With permission of: Canadian Diabetes Association Clinical Practice Guidelines Expert Committee Pharmacologic Management of Type 2 Diabetes. Can J Diabetes 2013;37(S61-S68)
Hypoglycemic Agents (Type 2 DM)

- **oral**
  - biguanide: metformin (GlucoPhage®)
  - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  - α-glucosidase inhibitor: acarbose (Precose®)
  - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
  - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicron®)
  - DPP-4 inhibitor: sitagliptin (Januvia®)
- **injectable**
  - GLP-1 analogue: liraglutide (Victoza®)

Other Medications Used in DM

- ACEI or ARB in those with any of:
  - clinical macrovascular disease
  - age ≥55
  - age <55 and microvascular complications
- statin in those with any of:
  - clinical macrovascular disease
  - age ≥40
  - age <40 and any of the following:
    - diabetes duration >15 yr and age >30 yr
    - microvascular complications
    - other cardiovascular risk factors
- low dose ASA (81-325 mg)
  - for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

**Dizziness**

- see **Otolaryngology, OT6**

**Epidemiology**

- 70% see general practitioners initially; 4% referred to specialists
- frequency proportional to age; commonest complaint of ambulatory patients age >75

**Differential Diagnosis**

- **Vertigo (vestibular)**
  - Objective (external world seems to revolve around individual) or subjective (individual revolves in space)
  - **Central (15%)**
    - Brainstem
    - Cerebellar
    - Tumour
    - Stroke
    - Drugs
    - Multiple sclerosis
  - **Peripheral (85%)**
    - Inner ear
    - Vestibular nerve
    - Idiopathic Menière’s
    - BPPV
    - Acoustic neuroma
    - Trauma
    - Drugs
    - Labyrinthitis
- **Psychogenic**
  - Diagnosis of exclusion
  - Feeling “light-headed,” “giddy,” “dazed,” “mentally confused,” or “disoriented”
  - **Vascular**
    - Etiology
    - Basilar migraine
    - TIA
    - Orthostatic hypotension
    - Stokes-Adams syndrome
    - Atrial fibrillation
    - CHF
    - Aortic stenosis
    - Vasovagal episodes
    - Metabolic causes
  - **Ocular**
    - Etiology
    - Decreased visual acuity

**Figure 11. Differential diagnosis of dizziness**

**History**

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (nonvestibular)
  - worse with exercise (cardiac/pulmonary causes)
Common Presenting Problems

associated symptoms
- neurologic (central)
  - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
  - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
- audiologic (peripheral)
  - hearing loss, tinnitus, otalgia, aural fullness
- others
  - N/V (peripheral vestibular disorders)
  - SOB, palpitations (hyperventilation, cardiac problem)
- general medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - depression/anxiety: can present with light-headedness

Physical Exam/Investigations
- syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, and vertebral doppler, EEG
- vertiginous
  - ENT and neurologic exams
  - Dix-Hallpike, consider audiometry and MRI if indicated
- non-syncopal, non-vertiginous
  - assess gait, vision and test for neuropathy
  - cardiac and neurologic exams
  - 3 min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

Treatment
- guided by history, physical exam, and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

Domestic Violence/Elder Abuse

INTIMATE PARTNER VIOLENCE

Definition
- includes physical, sexual, emotional, psychological, and financial abuse (see Emergency Medicine, ER27)

Epidemiology
- lifetime prevalence of intimate partner violence against women is between 25-30%
- women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, stress-related problems
- occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs
- physician recognition rates as low as 5%

Presentation
- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

Management
- screen ALL patients
  - always have a high index of suspicion
  - asking about abuse is the strongest predictor of disclosure
  - several screening tools (see sidebar) exist to identify victims of partner violence
  - make sure to determine the victim's level of immediate and long-term danger and ask if there are weapons in the house
  - ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation

Screening Instruments for Domestic Violence
A) Woman Abuse Screening Tool (WAST)-SHORT
1. In general how would you describe your relationship?
   a. A lot of tension
   b. Some tension
   c. No tension
2. Do you and your partner work out arguments with . . . ?
   a. Great difficulty
   b. Some difficulty
   c. No difficulty
Endorsing either question 1 (“a lot of tension”) or question 2 (“great difficulty”) makes intimate partner violence exposure likely

B) HITS
How often does your partner:
1. Physically hurt you?
2. Insult you?
3. Threaten you with harm?
4. Scream or curse at you?
Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)
A total score of 10.5 is significant
Dyspepsia

- see Gastroenterology, G10

**Definition and Clinical Features**
- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

**Epidemiology**
- annual incidence 1-2%, prevalence 20-40%

**Etiology**
- common: functional, PUD, GERD, gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

**History**
- symptoms may not be useful in finding cause
- associated with eating, anorexia, N/V, alcohol, NSAID use
- red flags: vomiting, bleeding/anemia, abdominal mass, dysphagia (VBAD)

**Investigations and Management**
- for new onset dyspepsia, test for *H. pylori* using the urea breath test or serology
- upper endoscopy (preferred), upper GI series (not in patients with alarm symptoms)
- lifestyle modifications: decreased caffeine and alcohol intake, avoid citrus food, avoid supine position right after meals, smoking cessation
- pharmacologic treatment
  - gastric acid suppression: H₂ blockers, PPIs; both are effective for PUD and GERD
  - prokinetics: e.g. Metoclopramide; effective for functional dyspepsia
  - *H. pylori* eradication
- do not keep patients on PPI without at least 1 trial off the medication per year (http://www.choosingwiselycanada.org/in-action/toolkits/bye-bye-ppi/)
- for non-responders, gastroscopy should be considered

**Dyspnea**

- see Respiratory, R3 and Emergency Medicine, ER26

**Definition**
- uncomfortable, abnormal awareness of breathing

**History and Physical Exam**
- history
  - cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema, SOB
  - asthma, allergy, eczema, ASA/NSAID sensitivity, nasal polyps
  - constitutional symptoms
  - smoking, recreational drugs, medications
  - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  - travel and birth place
  - FHx of atopy
  - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

**Dyspnea Bed Flags**
- Weight Loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset age >50

**H. pylori Eradication**
- Take the following 10 day treatment
  1) PPI 1 tablet 2x/d for 10 d and
  2) Amoxicillin 1 g twice a day for 5 d (day 1-5)
  Followed by
  3) Clarithromycin 500 mg 2x/d (day 6-10) and
  4) Metronidazole 500 mg 2x/d (day 6-10)

**Differential Diagnosis of Dyspnea**
- Pulmonary
  - COPD
  - Asthma
  - Restrictive lung disease
  - Pneumothorax
  - Congenital lung disease
  - PE
- Cardiac
  - CHF
  - CAD
  - MI (recent or past)
  - Cardiomyopathy
  - Valve dysfunction
  - Pericarditis
  - Arrhythmia
  - Hypertrophy
- Mixed/Other
  - Deconditioning
  - Trauma
  - Pain
  - Neuromuscular
  - Metabolic condition
  - Functional: anxiety, panic attack, hyperventilation

**ELDER ABUSE**
- see Geriatric Medicine, GM10

**How to Document Abuse**
- Take photographs (with permission) of proven or suspected injuries
- Use an injury location chart or “body map” when documenting physical findings
- Document any investigations ordered (e.g. x-ray)
- Write legibly or use a computer
- Record the patient’s own words in quotation marks
- Avoid phrases that imply doubt about the patient’s reliability (e.g. “patient claims that…”)
- Record the patient’s demeanor (e.g. upset, agitated)
- Record the time of day the patient is examined and how much time has elapsed since the abuse occurred

**RED FLAGS**
- vomiting, bleeding/anemia, abdominal mass, dysphagia (VBAD)

**Common Presenting Problems**
- see Geriatric Medicine, GM10

**How to Document Abuse**
- Take photographs (with permission) of proven or suspected injuries
- Use an injury location chart or “body map” when documenting physical findings
- Document any investigations ordered (e.g. x-ray)
- Write legibly or use a computer
- Record the patient’s own words in quotation marks
- Avoid phrases that imply doubt about the patient’s reliability (e.g. “patient claims that…”)
- Record the patient’s demeanor (e.g. upset, agitated)
- Record the time of day the patient is examined and how much time has elapsed since the abuse occurred

**Dyspepsia Red Flags**
- Weight Loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset age >50

**H. pylori Eradication**
- Take the following 10 day treatment
  1) PPI 1 tablet 2x/d for 10 d and
  2) Amoxicillin 1 g twice a day for 5 d (day 1-5)
  Followed by
  3) Clarithromycin 500 mg 2x/d (day 6-10) and
  4) Metronidazole 500 mg 2x/d (day 6-10)

**Differential Diagnosis of Dyspnea**
- Pulmonary
  - COPD
  - Asthma
  - Restrictive lung disease
  - Pneumothorax
  - Congenital lung disease
  - PE
- Cardiac
  - CHF
  - CAD
  - MI (recent or past)
  - Cardiomyopathy
  - Valve dysfunction
  - Pericarditis
  - Arrhythmia
  - Hypertrophy
- Mixed/Other
  - Deconditioning
  - Trauma
  - Pain
  - Neuromuscular
  - Metabolic condition
  - Functional: anxiety, panic attack, hyperventilation
Investigations
- CXR, ECG
- FTTs, ABG acutely if indicated

Management
- ABCs: send to ED if in severe respiratory distress
- depends on cause

Dysuria
- see Urology, U10

Definition
- the sensation of pain, burning, or discomfort on urination

Epidemiology
- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per yr
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

Etiology
- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

Table 14. Etiology, Signs and Symptoms of Common Causes of Dysuria

<table>
<thead>
<tr>

</tr>
<tr>
<td>Pyelonephritis</td>
<td><em>E. coli, S. saprophyticus, Proteus mirabilis, Enterobacter, Klebsiella, Pseudomonas</em></td>
<td>Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V</td>
</tr>
</tbody>
</table>

Investigations
- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrates and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for N. gonorrhoeae and C. trachomatis
- radiologic studies and other diagnostic tests if atypical presentation
- see Pediatrics, P62 for UTI

Management
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic, due to increased risk of pyelonephritis, preterm labour, low birth weight and perinatal mortality; need to follow with monthly urine cultures and retreat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
  - urethritis
  - when swab or PCR is positive for chlamydia or gonorrhea must report to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation

Cranberries for Preventing Urinary Tract Infections
Cochrane DB Syst Rev 2008;1:CD001321

Study: Meta-analysis of 10 RCTs (n=1,049).
Patients: All populations.
Intervention: Cranberry juice vs. placebo, juice or water was evaluated in seven studies, and cranberry tablets vs. placebo in four studies.
Main Outcome: UTIs – symptomatic and asymptomatic.
Results: Cranberry products significantly reduced the incidence of UTIs at 12 mo (OR 0.66, 95% CI 0.46-0.90) compared with placebo/control
Conclusion: There is some evidence that cranberry products may decrease the number of symptomatic UTIs over a 12 mo period, particularly for women with recurrent UTIs.

Prevention of UTIs
- Maintain good hydration (especially with cranberry juice) (recommendation level I)
- Wipe urethra from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse
Epistaxis

- see Otolaryngology, OT26

Erectile Dysfunction

- see Urology, U30

Definition

- consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of ≥3 mo duration

Epidemiology

- ~20% of men age 40; ~50% of men age 70

Etiology

- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie’s), neurologic (post-operative, DM), medications (clonidine, antihypertensives, psychotropics)
- psychogenic (10%)

Walsh PC, Campbell MF, Retik AB. Campbell’s Urology, 8th ed. W.B. Saunders, 2002. Table 46-4

History

- comprehensive sexual, medical, and psychosocial history
- time course
  - last satisfactory erection
  - gradual or sudden onset
  - attempts at sexual activity
- quantify
  - presence of morning or night time erections
  - stiffness (scale of 1-10)
  - ability to initiate and maintain an erection with sexual stimulation
  - erection stiffness during sex (scale of 1-10)
- qualify
  - partner or situation specific
  - loss of erection before penetration or climax
  - degree of concentration required to maintain an erection
  - percentage of sexual attempts satisfactory to patient and/or his partner
  - significant bends in penis or pain with erection
  - difficulty with specific positions
  - impact on quality of life and relationship

Investigations

- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
  - psychological and/or psychiatric consultation
  - in-depth psychosexual and relationship evaluation
  - nocturnal penile tumescence and rigidity (NPTR) assessment
  - vascular diagnostics (e.g. doppler studies, angiography)

The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction

Arch Intern Med 2011;171:1797-1803

Purpose: To evaluate the effectiveness of lifestyle interventions and pharmacotherapy for cardiovascular (CV) risk factors on severity of erectile dysfunction (ED).

Methods: Meta-analysis of RCTs with a follow-up of a minimum of 6 weeks, evaluating lifestyle intervention versus pharmacotherapy for CV risk factor reduction. Main outcome measure was weighted mean differences in the International Index of Erectile Dysfunction (IIEF-5) score.

Results: 6 RCTs with a total of 740 participants were included. Lifestyle modifications and pharmacotherapy for CV risk factor reduction were both associated with significant improvements in sexual function based on IIEF-5 scores (weighted mean difference [WMD]: 2.98, 95% CI 1.86-4.10). Excluding trials with lifestyle interference and pharmacotherapy interventions were associated with a statistically significant improvement in sexual function (WMD: 2.04, 95% CI 1.19-2.87). Conclusions: Lifestyle modifications and pharmacotherapy for CV risk reduction are effective in improving male sexual function.
Management

</tbody>
</table>

Common causes are in **bold**

### Investigations

- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations should be guided by history and physical exam and may include:
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vitamin B₁₂, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests
Common Presenting Problems

Treatment
- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - quick follow-up for reassurance
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
- prognosis: after 1 yr, 40% are no longer fatigued

CHRONIC FATIGUE SYNDROME

Definition (CDC 2006) – must meet both criteria
1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
2. concurrent presence of ≥4 of the following symptoms for a minimum of 6 mo
   - impairment of short-term memory or concentration, severe enough to cause significant decline in function
   - sore throat
   - tender cervical or axillary lymph nodes
   - muscle pain
   - multi-joint pain with no swelling or redness
   - new headache
   - unrefreshing sleep
   - post-exertion malaise lasting >24 h
- exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

Epidemiology
- F>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

Etiology
- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

Investigations
- no specific diagnostic laboratory tests

Treatment
- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
  - to relieve symptoms e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy, antihypotensive therapy

Fever
- see Pediatrics, P46

Definition
- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr

Common Presenting Problems

History
- fever
  - peak temperature, thermometer, route, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
  - symptoms of possible source
    - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
    - pneumonia: cough, pleuritic chest pain
    - URTI: cough, coryza, ear pain
    - meningitis: headache, confusion, stiff neck, rash
    - osteomyelitis: bone pain
    - skin: purulent discharge
    - PID: discharge, dyspareunia, lower abdominal pain
    - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
    - medications
      - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
      - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, day care, contact with TB, foodborne, animals

Possible Investigations
- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- LP

Management
- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

Headache
- see Neurology, N44

Primary Headaches

</tbody>
</table>

Secondary Headaches
- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening
Etiology
- aneurysm
- medication overuse headache
- space-occupying lesion
- systemic infection (meningitis, encephalitis)
- stroke
- subarachnoid hemorrhage
- systemic disorders (thyroid disease, HTN, pheochromocytoma, etc.)
- temporal arteritis
- traumatic head injuries
- TMJ or C-spine pathology
- serious ophthalmological and otolaryngological causes of headache

Investigations
- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

Management
- based on underlying disorder
- analgesics may provide symptomatic relief

Hearing Impairment

Definition
- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

Epidemiology
- prevalence increases with age (6% of 35–44 yr old, 43% of 65-84 yr old)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr

Classification
- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea or auditory nerve
- mixed

Assessment
- universal newborn hearing screening program in infants
- elderly
  - presbycusis is characterized by the progressive, symmetric loss of high-frequency hearing
  - tinnitus, vertigo, and disequilibrium may be present
  - can cause low self-esteem, isolation, and depression
  - whispered-voice test
  - whisper 6 test words 6 in-2 ft away from the patient’s ear out of the visual field, ask patient to repeat the words (with non-test ear distraction)
  - tuning fork test (to distinguish conductive from sensorineural hearing loss)
  - Rinne and Weber (not for general screening)
  - formal audiologic assessment
  - pure tone, air, and bone conduction testing
  - speech audiometry
  - impedance audiometry

Management
- counsel about noise control and hearing protection programs (Grade A evidence)
- investigations in patients with unexplained sensorineural hearing loss
  - blood sugar, CBC and differential, TSH, syphilis testing
- referral
  - refer patients with hearing loss for a complete audiological examination, and to ENT if etiology unknown
  - sudden sensorineural hearing loss: high dose oral steroids and urgent ENT referral
  - patients with progressive asymmetric sensorineural hearing loss should have an MRI/CT scan to exclude vestibular schwannoma (acoustic neuroma)
  - hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life
Hypertension

Hypertension Guidelines are reviewed and updated annually, for up-to-date recommendations, please see www.hypertension.ca/chep

Epidemiology

- 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
- lifetime risk of developing hypertension is approximately 90%
- 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they have HTN
- 3rd leading risk factor associated with death
  - risk factor for CAD, CHF, cerebrovascular disease, renal failure, peripheral vascular disease

Definitions

- HTN
  - BP ≥140/90 mmHg, unless DM (≥130/80 mmHg), or age ≥80 yr (≥150/90 mmHg)
- isolated systolic HTN
  - sBP ≥140 and dBP <90
  - associated with progressive reduction in vascular compliance
  - usually begins in 5th decade
- hypertensive urgency
  - sBP >210 or dBP >120 with minimal or no target organ damage
- hypertensive emergency
  - severe HTN (dBP > 120) + acute target-organ damage
- accelerated HTN
  - significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy, but without papilledema
- malignant HTN
  - sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
- white coat hypertension
  - high clinic BP with normal home BP and 24 ambulatory BP, caused by anxiety in clinic
- masked hypertension
  - normal clinic BP with high BP in home and/or ambulatory setting, often provoked by anxiety, job stress, exercise

Etiology

- essential (primary) HTN (>90%)
- undetermined cause
- secondary HTN (10%)

Predisposing Factors

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- age >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

Investigations

- for all patients with HTN
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
  - self-measurement of BP at home is encouraged (recommended devices listed at www.hypertension.ca)
- for specific patient subgroups
  - DM or chronic kidney disease: urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
- if suspected endocrine cause: plasma aldosterone, plasma renin (aldosterone-to-renin ratio)
  - measured from morning samples taken from patients in sitting position after resting 15 min
  - discontinue aldosterone antagonists, ARBs, β-blockers and clonidine prior to testing
- if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
  - echocardiography for left ventricular dysfunction assessment if indicated

**Diagnosis**
- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual

</tbody>
</table>

Follow-Up
- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification q3-6m
- pharmacological
  - q1-2mo until BP under target for 2 consecutive visits
  - more often for symptomatic HTN, severe HTN, antihypertensive drug intolerance, target organ damage
  - q3-6mo once at target BP
- referral is indicated for cases of refractory HTN, suspected secondary cause or worsening renal failure
- hospitalization is indicated for malignant HTN

</tbody>
</table>

History
- number of joints involved: monoarticular, oligoarticular, polyarticular
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- trauma, infection, medications (steroids, diuretics)
- morning stiffness (duration) vs. worse at end of day
- FHx of arthritis
- comorbidities: DM (carpal tunnel syndrome), renal insufficiency (gout) psoriasis (psoriatic arthritis), myeloma (low back pain), osteoporosis (fracture), obesity (OA)
- constitutional symptoms (neoplasms)

Physical Exam
- vitals
- specific joint exams
- systemic features (skin, nails, eyes, hands)

Investigations (Guided by the History and Physical Exam)
- general: CBC and differential, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology (ANA, anti-dsDNA, HLA-B27, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RhF and anti-CCP, etc.)
- synovial fluid analysis (cell count + differential, culture, Gram stain, microscopy)
- tissue cultures
- radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

Treatment
- patient education including lifestyle modifications
- physiotherapy, occupational therapy
- manage pain (acetaminophen, NSAIDs)
- treat specific causes (e.g. antibiotics, DMARDs etc., see Rheumatology, RH26)
Low Back Pain

- see Orthopedics, OR25

Definition
- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

Epidemiology
- 5th most common reason for visiting a physician
- lifetime prevalence: 90%, and peak prevalence: age 45-60
- largest WSIB category, and most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

Etiology
- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes
  - pain is worse with movement, better with rest
  - sprain (ligament), strain (muscle), facet joint degeneration, disc degeneration/herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis compression fracture, pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
    - cauda equina syndrome (areflexia, lower extremity weakness, decreased anal tone, saddle anesthesia, fecal incontinence, urinary retention), AAA (pulsatile abdominal mass)
  - medical conditions
    - neoplastic (primary, metastatic, multiple myeloma)
    - infectious (osteomyelitis, TB)
    - metabolic (osteoporosis, osteomalacia, Paget’s disease)
    - rheumatologic (ankylosing spondylitis, polymyalgia rheumatica)
    - referred pain (perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster)

Physical Exam
- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- ROM and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

Investigations
- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

Red Flags
- Bowel or bladder dysfunction
- Anesthesia (saddle)
- Constitutional symptoms/malignancy
- Chronic disease
- Paraparetic
- Age >50 and mild trauma
- IV drug use/Infection
- Neuromotor deficits

Indications for Lumbar Spine X-Ray
- No improvement after 6 wk
- Fever >38°C
- Unexplained weight loss
- Prolonged corticosteroid use
- Significant trauma
- Progressive neurological deficit
- Suspicion of ankylosing spondylitis
- History of cancer (rule out metastases)
- Alcohol/drug abuse (increased risk of osteomyelitis, trauma fracture)
A Summary of the Guideline for the Evidence-Informed Primary Care Management of Low Back Pain

This evidence-informed guideline is for non-specific, non-fragile low back pain in adults only.

Red Flags help identify rare, but potentially serious conditions. They include:
- Features of Cauda Equina Syndrome including sudden onset of loss of bladder/bowel control, saddle anesthesia (EMERGENCY)
- Severe worsening pain, especially at night or when lying down (URGENT)
- Significant trauma (URGENT)
- Weight loss, history of cancer, fever (URGENT)
- Use of steroids or intravenous drugs (URGENT)
- Patient with first episode over 50 years old, especially over 65 (SOON)
- Widespread neurological signs (SOON)

Yellow Flags* indicate psychosocial barriers to recovery. They include:
- Belief that pain and activity are harmful
- “Stirnness behaviors” (like extended rest)
- Low or negative mood, social withdrawal
- Treatment expectations do not fit best practice
- Problems with claim and compensation
- History of back pain, time-off, other claims
- Problems at work, poor job satisfaction
- Heavy work, unachievable hours (shift work)
- Depressive or family lack of support

Conduct a full assessment including:
- History taking
- Physical and neurological exam
- Evaluate on 9 Red Flags
- Psychosocial risk factors/ Yellow Flags

Any Red Flags?

Consider referring for evaluation and treatment (e.g., emergency room, surgical evaluation, relevant specialists)

Consider referring for evaluation and treatment (e.g., emergency room, surgical evaluation, relevant specialists)

Reasons (including Red Flags) if patient is not returning to normal function or symptoms are worsening

No irritative findings ± conduction loss

Not better with position changes

No change or worsens with extension

Improves with position changes

Dysphoric or family lack of support

Spinal Manipulative Therapy (SMT) for Acute Low-Back Pain

Cochrane Database Syst Rev 2012;19:CD008840

Purpose: To evaluate spinal manipulative therapy (SMT) for acute low back pain.

Methods: Meta-analysis of RCTs examining effectiveness of SMT (hands-on therapy directed towards spine, including both manipulation and mobilization) in adults with acute low back pain (pain lasting < 6 weeks). Studies involving patients with predominantly low back pain but radiating into the buttocks and legs were also included. Primary outcomes were back pain, back pain-specific functional status and recovery.

Results: 20 RCTs involving 1,674 participants were included. Low to very low quality evidence suggested no difference in effect for SMT compared to inert interventions, sham SMT or as an adjunct to another intervention, for the primary outcomes. Side-lying and supine thrust SMT techniques demonstrated a short-term significance difference when compared to non-thrust SMT techniques for outcomes of pain, functional status and recovery. Conclusions: SMT is not more effective than inert interventions, sham SMT or as an adjunct to another intervention for patients with acute low back pain, and does not appear any better than other recommended therapies either. Decision to refer patients for SMT should be based on costs, patient and provider preferences, and the relative safety of SMT relative to other treatment options.

Figure 13. Low back pain treatment
Menopause/Hormone Replacement Therapy

- see Gynecology, GY34

Epidemiology
- mean age of menopause = 51.4 yr

Clinical Features
- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- blood vessels and heart: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

Management
- encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1,200-1,500 mg/d) and vitamin D (800-2,000 IU/d)
- hormone replacement therapy (HRT)
  - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
  - regimens: cyclic estrogen-progesterin, continuous estrogen-progesterin, estrogen only (if no uterus), estrogen patch/gel/cream/ring/vaginal tablet
- increases risk of osteoporotic fractures, colorectal cancer
- increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
- initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
- consider venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

Osteoarthritis

- see Rheumatology, RH5

Epidemiology
- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

Clinical Features
- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

Investigations
- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

Management
- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g. canes, orthotics, raised toilet seats)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs in the lowest effective dose for the shortest duration of time, along with gastroprotection; COX-2 selective inhibitors (celecoxib/Celebrex®, Meloxicam/Mobicox®) are recommended if long-term treatment or if high risk for serious GI problems
  - combination analgesics (e.g. acetaminophen and codeine)
  - intra-articular hyaluronic acid injections
  - intra-articular corticosteroid injections (no more than 3-4x/yr) may be helpful in acute flares (benefits last 4-6 wk, can be up to 6 mo)
  - topical NSAID (diclofenac/Pennsaid®)
  - capsaicin cream (Zostrix®)
  - oral glucosamine
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

Glanosamine Therapy for Treating Osteoarthritis

**Purpose:** To evaluate the effectiveness and toxicity of glucosamine in osteoarthritis (OA) treatment.

**Methods:** Meta-analysis of RCTs evaluating effectiveness and safety of glucosamine relative to other interventions or placebo in OA treatment.

**Results:** 20 analyzed RCTs found glucosamine was superior to placebo with a 28% improvement in pain (standardized mean difference (SMD) -0.61, 95% CI -0.95 to -0.28) and a 21% improvement in function using the Lequesne index (SMD -0.51, 0.96 to 0.06). No statistically significant difference was found in terms of WOMAC pain, function and stiffness. In trials comparing a Rotta preparation of glucosamine to placebo, a statistically significant improvement in pain (SMD -1.31, -1.89 to -0.64) and function using the Lequesne index (SMD -0.51, -0.96 to 0.05) was seen, whereas those using a non-Rotta preparation did not show a significant difference for pain (SMD -0.15, -0.39 to 0.05) or function (SMD 0.02, -0.18 to 0.26). Compared to NSAIDs, Rotta preparation of glucosamine was found to be superior in 2 studies, showing slowing of radiological progression of knee OA over 3 years (SMD -0.24, 0.04 to 0.40), and equivalent in 1 study. Glucosamine was found to be comparable to placebo in number of participants reporting adverse reactions (risk ratio (RR) 0.91, 0.88 to 1.00).

**Conclusion:** While non-Rotta preparation of glucosamine did not show benefit in pain and WOMAC function, Rotta preparation was superior in placebo in treating pain and functional impairment associated with symptomatic OA. WOMAC pain, stiffness and function did not show significant differences between glucosamine and placebo for either glucosamine preparation. Glucosamine was found to be equally safe compared to placebo.

Common Presenting Problems

- see Family Medicine, FM40

Epidemiology
- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

Clinical Features
- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

Investigations

  - capsaicin cream (Zostrix®)
  - oral glucosamine
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)
Osteoporosis

- see Endocrinology, E40

Encourage basic bone health for all individuals over age 50, including regular active weight-bearing exercise, calcium (diet and supplements) 1,200 mg daily, vitamin D 800-2,000 IU (20-50 µg) daily and fall-prevention strategies.

Initial BMD testing

Assessment of fracture risk

Low risk (10-yr fracture risk <10%)

Moderate risk (10 yr fracture risk 10-20%)

High risk (10 yr fracture risk >20% or prior fragility fracture of hip or spine or >1 fragility fracture)

Lateral thoracolumbar radiography (T4-L4) or vertebral fracture assessment may aid in decision-making by identifying vertebral fractures.

Factors warranting consideration of pharmacologic therapy:
- Additional vertebral fracture(s) (by vertebral fracture assessment or lateral spine radiograph)
- Previous vertebral fracture in individuals aged >65 and those with T-score ≤2.5
- Lumbar spine T-score < <- femoral neck T-score
- Rapid bone loss
- Men undergoing androgen-deprivation therapy for prostate cancer
- Women undergoing aromatase inhibitor therapy for breast cancer
- Long-term or repeated use of systemic glucocorticoids (oral or parenteral) not meeting conventional criteria for recent prolonged use
- Recurrent falls (≤2 in the past 12 mo)
- Other disorders strongly associated with osteoporosis, rapid bone loss, or fractures

Reassess risk in 5 yr

Repeat BMD in 1-3 yr and reassess risk

Always consider patient preference

How much Calcium do we Need?

<table>
<thead>
<tr>
<th>Age</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>4-8</td>
<td>1,000 mg</td>
</tr>
<tr>
<td>9-18</td>
<td>1,300 mg</td>
</tr>
<tr>
<td>19-50</td>
<td>1,200 mg</td>
</tr>
<tr>
<td>&gt;50</td>
<td>1,200 mg</td>
</tr>
</tbody>
</table>

Pregnant and lactating women 1,800 mg

Calcium Content of Common Foods
- 1 cup milk = 300 mg
- ¼ cup yogurt = 332 mg
- ½ can salmon with bones = 240 mg
- 1 medium orange = 50 mg

Vitamin D Content in Food
- Milk fortified with vitamin D contains 100 IU/s per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IU/s of vitamin D

Disorders Strongly Associated with Osteoporosis Include:
- Primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing’s disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

10 Yr Fracture Risk Assessment
FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population. FRAX and CAROC are available online from: https://www.osteoporosis.ca/health-care-professionals/clinical-tools-and-resources/

Epidemiology
- for current guidelines and tools see www.osteoporosis.ca
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- affects 1 in 4 Canadian women and 1 in 8 Canadian men

Approach to Clinical Assessment
- identify risk factors on history and physical examination
  - history
    - prior falls, fragility fractures, or parental hip fractures, and gait or balance issues
    - glucocorticoid use
    - smoking and alcohol intake (≥3 units per day)
    - rheumatoid arthritis
  - physical examination
    - height annually (prospective loss >2 cm or historical loss >6cm) and weight (weight loss >10% since age 25)
    - rib-to-pelvis distance ≤2 fingers’ breadth
    - occiput-to-wall distance ≥5 cm
    - assess fall risk by ability to get up from chair without support with arms, and walking several steps and return

Assessment of fracture risk

Factors warranting consideration of pharmacologic therapy:
- Additional vertebral fracture(s) (by vertebral fracture assessment or lateral spine radiograph)
- Previous vertebral fracture in individuals aged >65 and those with T-score ≤2.5
- Lumbar spine T-score < <- femoral neck T-score
- Rapid bone loss
- Men undergoing androgen-deprivation therapy for prostate cancer
- Women undergoing aromatase inhibitor therapy for breast cancer
- Long-term or repeated use of systemic glucocorticoids (oral or parenteral) not meeting conventional criteria for recent prolonged use
- Recurrent falls (≤2 in the past 12 mo)
- Other disorders strongly associated with osteoporosis, rapid bone loss, or fractures

Reassess risk in 5 yr

Repeat BMD in 1-3 yr and reassess risk

Always consider patient preference

Good evidence of benefit from pharmacotherapy

Figure 15. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada (integrated management model). Adapted from: CMAJ 2010;182:1864-1873
Investigations
- CBC, Cr, corrected Ca\(^{2+}\), ALP, TSH, 25-OH-D (after 3-4 mo of adequate supplementation), and serum protein electrophoresis if there are vertebral fractures

Indications for Bone Mineral Density Testing and Management
- see Endocrinology, E41

Palliative and End-of-Life Care
- see Geriatric Medicine, GM13

Rash
- see Dermatology, D13

Sexually Transmitted Infections
- see Gynecology, GY27

Definition
- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

Epidemiology
- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes (increasing incidence of chlamydia and gonorrhea)
  - less common: hepatitis B, HIV, and syphilis (increasing in incidence), trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

History
- sexual history
  - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, contraception, previous STIs and testing (including Pap tests), partner communication regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

Investigations/Screening
- individuals at increased risk, even those who are asymptomatic, should be screened for chlamydia, gonorrhea, hepatitis B, HIV, and syphilis
- Pap test if none performed in the preceding 12 mo

Management
- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil\(^\text{®}\) to women over 9 years of age (can be offered to men as well but not covered by OHIP)
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- an STI patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonal infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis

Conclusion
- Systematic review of RCTs involving women between the ages of 9 and 25 years, randomly assigned to receive vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form or placebo. Main outcomes were prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma in situ of the cervix, or cancer of the cervix associated with HPV infection).
- Results: Six studies involving 47,236 women were included. Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% (95% CI 87-96%) and 63% (95% CI 57-70), respectively. More symptoms were found in the bivalent vaccine group (55%, 5-7%) compared to control groups.
- Conclusion: Prophylactic vaccination can prevent HPV infection in women aged 9 to 26 years not previously infected with HPV subtypes covered by the vaccines.
### Table 25. Diagnosis and Treatment of Common STIs

<table>
<thead>
<tr>
<th>STI</th>
<th>Signs and Symptoms</th>
<th>Investigations</th>
<th>Treatment</th>
<th>Complications</th>
</tr>
</thead>
</table>
| **Gonococcal Urethritis/Cervicitis** *(Neisseria gonorrhoeae)* | M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, Sx of epididymitis  
F: mucopurulent endocervical discharge, vaginal bleeding dysuria, pelvic pain, dyspareunia  
M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex | M: u etral swab for Gram stain and culture  
F: urine PCR, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomons)  
M and F: urine PCR, rectal/ pharyngeal swabs if indicated | Ceftriaxone 250 mg IM single dose*  
If risk factors for treatment failure (e.g. pregnancy, pharyngeal/rectal infection, potentially reduced susceptibility) Test of cure: culture 4 d post-treatment (preferred) or urine PCR 2 wk post treatment (alternative)  
If no risk factors, rescreeen 6-12 months post treatment | M: urethral strictures, epididymitis, infertility  
F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain  
M and F: Arthritis, increased risk of acquiring and transmitting HIV |
| **Human Papillomavirus** *(genital warts, cervical dysplasia)* | ~70% asymptomatic  
If symptoms appear (usually 2-5 wk after infection) then similar to gonococcal symptoms (see above)  
M: cauliflower lesions (condylomata acuminata) on skin/mucosa of perineum or anal area  
F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva | Same as above  
None needed if simple condylomata  
F: screening for cervical dysplasia through regular Pap smears | Same as above  
Azithromycin 1 g PO single dose + ceftriaxone 250 mg IM single dose*  
Same follow-up as above | Same as above |
| **Genital Herpes** *(HSV-1 and -2)* | 1° episode: painful vesiculocervate genital lesions = fever, tender lymphadenopathy, protracted course  
Recurrent episodes: less extensive lesions shorter course may have “trigger factors” | Swab of vesicular content for culture, type-specific serologic testing for HSV-1 vs. HSV-2 antibodies and to determine 1° vs. recurrent episode | Same follow-up as above  
Acyclovir 200 mg PO 5x/d x 5-10 d or Famiciclovir 250 mg PO tid x 5 d or Valacyclovir 1,000 mg PO bid x 10 d  
Famciclovir 125 mg PO bid x 5 d or Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d or Famiciclovir 125 mg PO bid x 5 d or Valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d | Same follow-up as above  
Valacyclovir 1,000 mg PO bid x 10 d  
Famciclovir 250 mg PO tid x 5 d  
Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d or Famiciclovir 125 mg PO bid x 5 d or Valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d | Same follow-up as above  
Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d or Famiciclovir 125 mg PO bid x 5 d or Valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d |
| **Infectious Syphilis** *(Treponema pallidum)* | 1°: chancre (painless sore), regional lymphadenopathy  
2°: rash and flu-like symptoms, meningoencephalitis, headache, uveitis, retinitis, condyloma lata, mucus lesions, alopecia  
Latent Phase: asymptomatic  
3°: neurologic, cardiovascular, and tissue complications | Specimen collection from 1° and 2° lesions, screen high risk individuals with serologic syphilis testing (VORL), universal screening of pregnant women | Benzathine penicillin G IM (dose depends on stage and patient population. Check Public Health Canada guideline | Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV |

---

**Sinusitis**

- **see Otolaryngology, OT24**

**Etiology**

- viral etiology is more common  
- viral: rhinovirus, influenza, parainfluenza  
- bacterial: *S. pneumoniae, H. influenzae, M. catarrhalis*

**Management of Acute Sinusitis**

- may provide symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants  
- do not prescribe antihistamines  
- intra-nasal corticosteroids if diagnosed with mild to moderate acute bacterial sinusitis  
- antibiotics and intra-nasal corticosteroids if diagnosed with severe acute bacterial sinusitis  
- first-line antibiotic is amoxicillin, and second line is amoxicillin-clavulanic acid or a fluoroquinolone  
- ENT referral if: anatomic defect, polyph, adenoid hypertrophy, failure of second-line therapy, or ≥4 episodes/yr, refer urgently when there is development of complications (e.g. orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis), altered mental status, headache, systemic toxicity, or neurological findings
Sleep Disorders

- see Respiratory, R32 and Neurology, N46

Definition
- most often characterized by one of three complaints
  - insomnia
    - difficulty falling asleep, difficulty maintaining sleep, early-morning wakening, non-refreshing sleep
  - parasomnias
    - night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
  - excessive daytime sleepiness

Epidemiology
- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems
Etiology
- primary sleep disorders
  - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, GHE, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
  - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy, β-agonists, antidepressants, steroids
  - psychiatric: mood and anxiety disorders
  - lifestyle factors: shift work, jet-lag

Investigations
- complete sleep diary every morning for 1-2 wk
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

Treatment of Specific Problems

Primary insomnia
- majority of cases
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  - treat any suspected medical or psychiatric cause
  - exercise regularly, avoid heavy exercise within 3 h of bedtime
  - first-line treatment (CBT)
    - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
    - relaxation therapy: deep breathing, meditation, biofeedback
    - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    - sleep restriction therapy: total time in bed should closely match the total sleep time of the patient (improves sleep efficacy)
    - address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  - pharmacologic treatment (used to supplement CBT; short-term prescription of <14 d with appropriate follow-up in 7-14 d):
    - short-acting benzodiazepines (e.g. lorazepam, oxazepam, temazepam) at the lowest effective dose should be used <7 consecutive nights to break cycle of chronic insomnia or to manage an exacerbation of previously controlled primary insomnia
    - non-benzodiazepines: zopiclone (Imovane®), zolpidem (Sublinox®), melatonin, low dose antidepressants with sedating properties (amitriptyline, trazadone, mirtazapine)
    - if no progress or limited improvement, consider referral to sleep medicine program

Snoring
- results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - sleep on side (position therapy), weight loss
    - nasal dilators (noninvasive external dilator made with elastic adhesive backing applied over nasal bridge), tongue-retaining devices, mandibular advancement devices
    - at risk of developing obstructive sleep apnea

Obstructive Sleep Apnea (OSA)
- apnea (no breathing for ≥10 s) resulting from upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
- leads to a distinctive snoring, choking, awakening type pattern as the body rouses itself to open the airway (resusciative breath)
- apneic episodes can last from 20 s-3 min and occur 100-600 episodes/night
- diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per hour of sleep with arousal recorded
- consequences
  - daytime somnolence; non-restorative sleep
  - poor social and work performance
  - mood changes: anxiety, irritability, depression
  - sexual dysfunction: poor libido, impotence
  - morning headache (due to hypercapnia)
  - HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
  - OSA is an independent risk factor for CAD
  - pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
  - memory loss, decreased concentration, confusion

Risk Factors for Obstructive Sleep Apnea
- 2% of women, 4% of men between ages 30-60
- obesity (due to upper airway narrowing), BMI >28 kg/m² present in 60-90% of cases
- children (commonly due to large tonsils and adenoids)
- aging (due to decreased muscle tone)
- persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroGLOSSIA), neuroMuscular disease
- family history
Common Presenting Problems

■ investigations
  ◆ measure BP; inspect nose and oropharynx (enlarged adenoids or tonsils)
  ◆ blood gas not helpful, TSH if clinically indicated
  ◆ nocturnal polysomnography

■ treatment
  ◆ modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
  ◆ primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
  ◆ surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
  ◆ report patient to Ministry of Transportation if OSA is not controlled by CPAP

Sore Throat (Pharyngitis)

Definition

- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

Etiology

- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: Group A β-Hemolytic Streptococcus (GABHS), Group C and Group B-Hemolytic Streptococcus, Neisseria gonorrhoeae, Chlamydia pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae

Epidemiology

- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - GABHS (Group A β Hemolytic Streptococcal Infections)
    - most common bacterial cause
    - occurs most often in winter months
    - 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
    - most prevalent between 5-17 yr old

Clinical Features

- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - common viral infections
    - EBV (infectious mononucleosis)
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
    - coxsackie virus (hand, foot, and mouth disease)
      - primarily late summer, early fall
      - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
      - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
    - herpes simplex virus
      - like coxsackie virus but ulcers are fewer and larger
    - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications: rheumatic fever, glomerulonephritis, suppurative complications (abscess, sinusitis, otitis media, cervical adenitis, pneumonia), meningitis, impetigo

Investigations

- suspected GABHS
  - see Table 26 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
  - suspected EBV (infectious mononucleosis)
    - peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or "monospot")
Table 26. Modified Centor Score: Approach to Diagnosis and Management of GABHS

</table>

---

Management

- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and supplicative complications
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least one month or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT

Epidemiology

- 50-75% of Canadians report some use of CAM over their lifetime and only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
  - examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

Herbal Products

- over 50% of Canadians use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John’s wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - Are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - Are you allergic to any plant products?
  - Are you pregnant or breastfeeding?
- information resources: National Centre for CAM (www.nccam.nih.gov), Health Canada website

### Table 1. Summary of Gastrointestinal Tract Structure and Function

<table>
<thead>
<tr>
<th>Organ</th>
<th>Function</th>
<th>Blood Supply</th>
<th>Innervation</th>
<th>Histology and Structural Features</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Esophagus</strong></td>
<td>Muscular tube approximately 40 cm long with a diameter of 2 cm Extends from pharynx to the stomach</td>
<td>Arterial: left gastric artery and left inferior phrenic artery Venous Left gastric vein → portal venous system Esophageal veins → azygos vein → IVC (systemic)</td>
<td>Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks) Sympathetic innervation via thoracic trunks of the greater splanchnic nerves</td>
<td>Mucosa: stratified squamous epithelium Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells Muscularis propria (muscularis externa); inner circular, outer longitudinal muscle Upper 1/3: stratified muscle Middle 1/3: transition zone Lower 1/3: smooth muscle</td>
</tr>
<tr>
<td><strong>Stomach</strong></td>
<td>Delivers food to intestine for digestion and absorption Secretes acid, probably to reduce enteric infections/pneumonia; facilitate digestion of protein/iron/B12 Secretes intrinsic factor to facilitate B12 absorption Minor contribution to initial protein digestion via pepsin</td>
<td>Lesser curvature Right and left gastric arteries (from celiac trunk) Greater curvature Right and left gastro-omental (gastroepiploic) arteries (from gastroduodenal and splenic arteries respectively) Fundus: short and posterior gastric arteries (from the splenic artery)</td>
<td>Parasympathetic innervation via vagus nerve Sympathetic innervation via vagus nerve Sympathetic innervation via vagus nerve Parasympathetic innervation via vagus nerve (from T6-T9)</td>
<td>5 parts Cardia Fundus Body Antrums Pylorus 4 parts Superior (5 cm) Descending (7-10 cm) Horizontal (6-6 cm) Ascending (5 cm) 1st part is intrapertoneal; rest is retroperitoneal</td>
</tr>
<tr>
<td><strong>Duodenum</strong></td>
<td>Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion Secretes CCK to stimulate bile secretion Site of iron absorption</td>
<td>Branches of celiac artery and superior mesenteric artery</td>
<td>Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves</td>
<td>4 parts Cardia Fundus Body Antrums Pylorus 1st part is intrapertoneal; rest is retroperitoneal</td>
</tr>
<tr>
<td><strong>Jejunum</strong></td>
<td>Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K) Absorption of water (5-10% of total water)</td>
<td>Superior mesenteric artery</td>
<td>Parasympathetic innervation via fibres of the posterior vagal trunk Sympathetic innervation via fibres of T8 T10</td>
<td>Deep red colour 2-4 cm in thickness Thick and heavy wall Plicae circulares are large, tall, and closely packed Has long vasa recta Scant fat in mesentery Scant Peyer’s patches</td>
</tr>
<tr>
<td><strong>Ileum</strong></td>
<td>Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B12 absorption), and bile salts (entero-hepatic circulation)</td>
<td>Superior mesenteric artery</td>
<td>Same as jejunum</td>
<td>When compared to jejunum Paler pink colour 2-3 cm in thickness Thin and light walls Plicae circulares are small and sparse Contains more mesenteric fat Many Peyer’s patches</td>
</tr>
<tr>
<td><strong>Large Bowel</strong></td>
<td>Absorption of water (5-10% of total water) Bacteria: further digestion of chyme and metabolism of undigested CHO to short chain fatty acids Formation and storage of feces</td>
<td>Branches of superior and inferior mesenteric arteries Rectal blood supply; sigmoid, right pudendal, and rectal arteries</td>
<td>Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves</td>
<td>Consists of cecum, colon (ascending, descending, and sigmoid), rectum and anal canal Features include teniae coli, haustra, and omental appendices</td>
</tr>
<tr>
<td><strong>Liver</strong></td>
<td>Glucose homeostasis Plasma protein synthesis Lipid and lipoprotein synthesis Bile acid synthesis and secretion Vitamin A, D, E, K, B12 storage Biotransformation, detoxification Excretion of compounds</td>
<td>2 sources Portal vein (75-80%) Hepatic artery (20-25%)</td>
<td>Parasympathetic innervation via fibres of the anterior and posterior vagal trunks Sympathetic innervation via fibres of the celiac plexus</td>
<td>Largest internal organ Composed of 4 lobes (left, right, caudate, quadrate), and divided into 8 segments</td>
</tr>
<tr>
<td><strong>Biliary Tract</strong></td>
<td>Gallbladder functions to store and release bile that is produced in the liver Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids, and bilirubin CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release</td>
<td>Cystic artery</td>
<td>Parasympathetic innervation via vagus nerve Sympathetic and visceral innervation via celiac nerve plexus Somatic afferent fibres via I sigh phrenic nerve</td>
<td>Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater</td>
</tr>
<tr>
<td><strong>Pancreas</strong></td>
<td>Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the a, j, and B cells, respectively) Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase</td>
<td>Anterior superior pancreaticoduodenal artery (from the celiac trunk) Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery) Dorsal pancreatic artery (from the splenic artery) Pancreatic veins drain into the portal, splenic, and superior mesenteric veins</td>
<td>Parasympathetic innervation via vagus nerve Sympathetic innervation via abdominopelvic splanchnic nerves</td>
<td>4 parts of pancreas: head (includes uncinate process), neck, body, and tail (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater Accessory pancreatic duct connected directly to duodenum</td>
</tr>
</tbody>
</table>
Visualizing the GI Tract

- see Medical Imaging, MI15

Esophagus, Stomach, Duodenum
OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation e.g. treatment of esophageal strictures)
- consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulas
- endotracheal intubation first if massive upper GI bleed, acidemia, or inability to protect airway

Small Bowel
- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
- note: MRI enteroclysis: luminal contrast administered by nasojejunal tube to dilate the small bowel – disliked by both radiologist and patient, but may improve sensitivity
- “double balloon” enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum or into ileus from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

Colon and Terminal Ileum
- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography (“virtual colonoscopy”) more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is less sensitive. Most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture)
- most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture)

Pancratic/Biliary Duct
- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if therapeutic intervention likely to be required: strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required

Differential Diagnosis of Common Complaints

- see General Surgery GS4

Acute Upper Abdominal Pain
Remember to rule out thoracic sources, e.g. myocardial infarction, pneumonia, dissecting aneurysm

Obscure But Treatable Causes of Abdominal Pain
- Acute Intermittent Porphyria
- Hereditary Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

Inflammatory Diarrhea: Occurs when there is damage to the mucosal lining or brush border, which leads to a passive loss of protein-rich fluids and a decreased ability to absorb these lost fluids. Diarrhea may be profuse or very small in volume. Often associated with abdominal pain = fever and chills

Non-Inflammatory Diarrhea: No damage to the mucosal lining, N/V may be present. Fever, chills, blood in the stool, severe abdominal pain or tenderness are not present.

Esophagus

Gastroesophageal Reflux Disease

**Definition**
- a condition which develops when the reflux of gastric content causes troublesome symptoms or complications

**Etiology**
- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see General Surgery, GS13)

**Clinical Features**
- “heartburn” (pyrosis) and acid regurgitation (together are 80% sensitive and specific for reflux) ± sour regurgitation; less sensitive and less specific: water brash, sensation of a lump in the throat (globus sensation), and frequent belching
- non-esophageal symptoms are increasingly recognized of being poor predictors of reflux

**Investigations**
- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- gastroscopy indications (*Ann Intern Med* 2012;157:808-816)
  - absolute indications
    - heartburn accompanied by red-flags (bleeding, weight loss, etc.)
    - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
    - history suggests esophageal stricture especially dysphagia
    - high risk for Barrett’s (male, age >50, obese, white, tobacco use, long history of symptoms)
    - repeat esophagoscopy after 6-8 wks of PPI therapy indicated if: severe esophagitis because it can mask Barrett’s esophagus or symptoms

**Figure 2. Signs and symptoms of GERD**

**Figure 3. Classification and gastroscopic findings of GERD**

**Bowel Ischemia**
- The splenic flexure and rectosigmoid junction are watershed areas and are susceptible to ischemia. History and symptoms include acute onset crampy left abdominal pain, absence of abdominal tenderness on exam, rectal bleeding, and risk factors for embolization, atherosclerosis and atrial fibrillation

**Dyspepsia**
- postprandial fullness, early satiety, epigastric pain, or burning

**Foods/Substances that may aggravate GERD**
- Alcohol
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices
• esophageal manometry (study of esophageal motility)
  • done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function; exclude alternative diagnoses like scleroderma and achalasia
  • surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
  • 24 h pH monitoring: most accurate test for reflux, but not required or performed in most cases
  • most useful if PPIs do not improve symptoms

Treatment

• PPIs are the most effective therapy and usually need to be continued as maintenance therapy
  • on-demand: antacids (Mg(OH)2, Al(OH)3, alginate), H2-blockers, or PPIs can be used for NERD
  • diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes, and citrus juices
  • only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
  • symptoms may recur if therapy is discontinued

Complications

• esophageal stricture disease – scarring can lead to dysphagia (solids)
• esophagitis
• ulcer
• bleeding
• Barrett’s esophagus and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

Barrett’s Esophagus

Definition

• metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

Etiology

• thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

Epidemiology

• in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett’s esophagus
• up to 10% of GERD patients will have already developed BE by the time they seek medical attention
• more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

Pathophysiology

• endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
• BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

Significance

• rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
• risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 3-8 yr of surveillance
• increased gastric acid secretion is more frequently associated with Barrett’s esophagus as opposed to reflux alone

Treatment

• acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
• surveillance gastroscopy every 3 years if no dysplasia
• high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/ resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
• if low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options

Barrett’s Esophagus

Definition

• metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

Etiology

• thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

Epidemiology

• in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett’s esophagus
• up to 10% of GERD patients will have already developed BE by the time they seek medical attention
• more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

Pathophysiology

• endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
• BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

Significance

• rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
• risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 3-8 yr of surveillance
• increased gastric acid secretion is more frequently associated with Barrett’s esophagus as opposed to reflux alone

Treatment

• acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
• surveillance gastroscopy every 3 years if no dysplasia
• high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/ resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
• if low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options
Dysphagia

**Definition**
- difficulty swallowing

**Clinical Features**
- dysphagia with solids and liquids
- chest pain (in some disorders)

**Diagnosis**
- motility study (esophageal manometry)
- barium swallow sometimes helpful

**Causes**
- idiopathic
- achalasia (painless)
- scleroderma (painless)
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

**Table 3. Esophageal Motor Disorder**

<table>

<td>Systemic disease characterized by vascopathy and tissue fibrosis (especially skin thickening)</td>
<td>Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)</td>
</tr>
<tr>
<td><strong>Etiology</strong></td>
<td>Usually idiopathic</td>
<td>Includes autoimmune, genetic, hormonal, and environmental factors</td>
<td>Idiopathic</td>
</tr>
<tr>
<td><strong>Pathophysiology</strong></td>
<td>Inflammatory degeneration of Auerbach’s plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis</td>
<td>Bld d vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia</td>
<td>Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis</td>
</tr>
<tr>
<td><strong>Diagnosis</strong></td>
<td>CXR: no air in stomach, dilated esophagus</td>
<td>Clinical features of scleroderma: Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus</td>
<td>Barium x-ray: “Corkscrew pattern”</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td>Dilatation of LES with balloon, GERD prophylaxis, 50% good response, can repeat, risk of perforation (5%)</td>
<td>Medical: aggressive GERD therapy (PPIs bd)</td>
<td>Reassurance not cardiac pain, medical: nitrates, calcium channel blockers, anticholinergics have variable benefit</td>
</tr>
</tbody>
</table>
**Esophageal Diverticula**

**Definition**
- outpouchings of one or more layers of the esophageal tract

**Clinical Features**
- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

**Classification**
- classified according to location
  - pharyngoesophageal (Zenker’s) diverticulum
    - most frequent form of esophageal diverticulum
    - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
    - symptoms: dysphagia, regurgitation of undigested food, halitosis
    - treatment: small and asymptomatic: no treatment required, large and symptomatic: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac.
  - mid-esophageal diverticulum
    - secondary to mediastinal inflammation (‘traction diverticulae), motor disorders
    - usually asymptomatic; no treatment required
  - just proximal to LES (pulsatile type)
    - usually associated with motor disorders
    - usually asymptomatic, no treatment required

**Peptic Stricture (from Esophagitis)**
- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

**Treatment**
- endoscopic dilatation and indefinite PPI

**Esophageal Carcinoma**
- see General Surgery, GS15

**Webs and Rings**
- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

**Clinical Features**
- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
  - mucosal ring at squamo-columnar junction above a hiatus hernia
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic bougie

**Infectious Esophagitis**

**Definition**
- severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

**Risk Factors**
- DM
- chemotherapeutic agents
- immunocompromised states

**Clinical Features**
- characteristically odynophagia, less often dysphagia
- diagnosis is via endoscopic visualization and biopsy

**Appearance**
- Candida (most common): whitish-yellow plaques without visible ulceration or inflammation
- Herpes (second most common), CMV: focal ulcers

*Plummer-Vinson Syndrome Triad*
- Iron deficiency anemia
- Dysphagia
- Esophageal webs
* rare (prevalence <1 in 1,000,000) but good prognosis when treated with iron and esophageal dilatation

*Eosinophilic Esophagitis*
- Eosinophils infiltrate the epithelium of the esophagus
- Causes odynophagia, dysphagia, common cause of bolus food impaction
- Usually primary, but can be part of the spectrum of eosinophilic gastroenteritis, secondary to drugs, parasites etc.
- Often associated with allergies
- Most characteristically occurs in young men
- Diagnosis established by endoscopic biopsy, suggested by mucosal rings seen in the esophageal mucosa at endoscopy
- Treatment: (a) diet, (b) swallowed corticosteroid nasal spray (fluticasone), (c) swallowed viscous corticosteroid (budesonide mixed with sucralose)
Stomach and Duodenum

Dyspepsia

Definition
- one or more of the following symptoms: postprandial fullness, early satiation, epigastric pain or burning (Rome IV criteria)
- multiple causes: esophagitis, GERD, peptic ulcer, stomach cancer, drugs, but overall functional disease is most common

History and Physical Exam
- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett’s sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

Investigations
- laboratory: usual (CBC, liver enzymes, glucose, Cr, etc.), amylase, albumin, calcium, protein electrophoresis, TSH, H. pylori serology
- consider trial of empiric anti-secretory drug therapy, non-invasive testing for H. pylori infection, endoscopy; barium radiography is outdated

</tbody>
</table>

Figure 5. Stimulation of H+ secretion from the parietal cell

The most common cause of dyspepsia is functional (idiopathic) dyspepsia

Red Flags of Dyspepsia (raise suspicion of gastric malignancy):
- Unintended weight loss
- Persistent vomiting
- Progressive dysphagia
- Odynophagia
- Unexplained anemia or iron deficiency
- Hematemesis
- Jaundice
- Palpable abdominal mass or lymphadenopathy
- Family history of upper GI cancer
- Previous gastric surgery

Investigations via endoscopic visualization and biopsy

Treatment
- Candida: nystatin swish and swallow, ketoconazole/fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV ganciclovir, famciclovir, or oral valganciclovir
Gastritis

Definition
• defined histologically: inflammation of the stomach mucosa

Etiology
• some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

Table 5. Updated Sydney Classification of Gastritis

<table>
<thead>
<tr>
<th>Type</th>
<th>Common Etiology</th>
</tr>
</thead>

</tr>
<tr>
<td>Non-infectious granulomatous</td>
<td>Crohn’s disease, sarcoidosis</td>
</tr>
<tr>
<td>Other infectious gastritides</td>
<td>Bacteria, viruses, fungi parasite, TB, syphilis</td>
</tr>
</tbody>
</table>

Clinical Features
• non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn’s disease), does not cause pain; difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
• erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

Treatment
• determined by etiology (see H. pylori, G13, NSAID, G13 and Stress-Induced Ulceration, G14)
• non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs, and foods that trigger symptoms

Peptic Ulcer Disease

Definition
• focal defects in the mucosa that penetrate the muscularis mucosal layer results in scarring (defects superficial to the muscularis mucosa are erosions and do not cause scarring)
• peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

Etiology

Table 6. Etiology of Peptic Ulcer Disease

</tbody>
</table>

NSAID negative, H. pylori negative ulcers becoming more commonly recognized
• others: CMV, ischemic, idiopathic
• alcohol: damages gastric mucosa but rarely causes ulcers
• peptic ulcer associated with cigarette smoking, cirrhosis of liver, COPD, and chronic renal failure

Clinical Features
• dyspepsia: most common presenting symptom
  • only 5% of patients with dyspepsia have ulcers, while most have functional disease
  • may present with complications
  • bleeding 10% (severe if from gastroduodenal artery), perforation 2% (usually anterior ulcers), gastric outlet obstruction 2%
  • posterior inflammation (penetration) 2%; may also cause pancreatitis
• duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  • epigastric pain; may localize to tip of xiphoid
  • burning
  • develops 1-3 h after meals
  • relieved by eating and antacids
  • interrupts sleep
  • periodicity (tends to occur in clusters over wk with subsequent periods of remission)
• gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

Investigations
• endoscopy (most accurate)
• upper GI series
• H. pylori tests (see Table 7)
• fasting serum gastrin measurement if Zollinger-Ellison syndrome suspected (but most common cause of elevated serum gastrin level is atrophic gastritis)

Treatment
• specific management depends on etiology; (see H. pylori, G13, NSAID-Induced Ulceration, G13 and Stress-Induced Ulceration, G14)
• eradicate H. pylori if present; chief advantage of triple therapy over PPI is to lower ulcer recurrence rate
• stop NSAIDs if possible
• start PPI: inhibits parietal cell H+/K+-ATPase pump which secretes acid
• heals most ulcers, even if NSAIDs are continued
• other medications (e.g. histamine H2-agonists) less effective
• discontinue cigarette smoking
• no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol, and spices

Management of Bleeding Peptic Ulcers
• OGD to explore upper GI tract
• IV pantoprazole continuous drip
• establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  • clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  • endoscopic signs of recurrent bleeding (active bleeding visible vessel, clot, red spot) more predictive than clinical risk factors
  • if ulcer possesses high risk stigmata, then endoscopic therapy should be performed, consider ICU admission

Suspected Bleeding Peptic Ulcer
ABCs: assess vitals (BP and HR, orthostatic changes)
CBC, lytes, BUN, Cr, INR, blood type, cross and type
Resuscitate: crystalloids and blood products if indicated
Consider
NG tube placement + aspiration: confirm upper GI source
IV pantoprazole: 80 mg starting dose + 8 mg/h continuous infusion
Erythromycin 250 mg 30 min before endoscopy
Endoscopy
Active bleeding or visible vessel
High Risk:
Hemostasis: clips, thermal coagulation ± epinephrine injection
Continue (or start) IV PPI
Monitor for re-bleeding in hospital
If adherent clot: consider removal
Low Risk:
No hemostasis necessary
Continue (or start) oral PPI
Decreased need for in-hospital monitoring
Post-Endoscopy
Resume clear fluids 6 hours post-endoscopy
Test for H. pylori
Counsel re: most likely causes (NSAIDs, anti-platelet agents)
If re-bleeding: repeat endoscopy with aim of hemostasis
Consult interventional radiology or surgery if needed

Figure 6. Approach to management of suspected bleeding peptic ulcer
Adapted from: Grahek C, Barkan A, Barbour M. Management of acute bleeding from a peptic ulcer. NEJM 2008;359:928-937
### H. pylori-Induced Peptic Ulceration

**Pathophysiology**
- *H. pylori*: Gram-negative flagellated rod that resides within the gastric mucosa, causing persistent infection and inflammation
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- theories of how *H. pylori* causes ulcers: none satisfactory, but pattern of colonization correlates with outcome
- gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
- gastritis throughout stomach (“pangastritis” – 85% of patients), low gastric acid associated with stomach ulcer and cancer

**Epidemiology**
- *H. pylori* is found in about 20% of all Canadians
- highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

**Outcome**
- gastritis (non-erosive) in 100% of patients but asymptomatic
- peptic ulcer in 15% of patients
- gastric carcinoma and mucosal associated lymphomatous tissue [MALT] lymphoma in 0.5% of patients
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children <5 yr of age)

**Diagnosis**

| Table 7. Diagnosis of *H. pylori* Infection |
|-------------------------------|------------------|------------------|
| **Test**                      | **Sensitivity**  | **Specificity**  | **Comments**                      |
| Non-invasive Tests            |                  |                  |                                  |
| Urea breath test              | 90-100%          | 89-100%          | Affected by PPI therapy (false negatives) |
| Serology                      | 88-99%           | 89-95%           | Can remain positive after treatment |
| Feca antigen                  |                  |                  | Only rarely used in clinical practice |
| Invasive Tests (require endoscopy) |                  |                  |                                  |
| Histology                     | 93-99%           | 95-99%           | Gold standard; affected by PPI therapy (false negatives) |
| Rapid urease test (on biopsy) | 89-98%           | 93-100%          | Rapid                           |
| Microbiology culture          | 98%              | 95-100%          | Research only                    |

**Treatment: *H. pylori* Eradication**
- Bismuth quadruple therapy recommended for 10-14 d: PPI (e.g. lansoprazole 30mg bid) + bismuth 525 mg qid + metronidazole 250mg qid + tetracycline 500mg qid
- Alternatively, concomitant nonbismuth quadruple therapy for 10-14 d: PPI + amoxicillin + metronidazole + clarithromycin

**NSAID-Induced Ulceration**
- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
- erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically silent: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

**Pathophysiology**
- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions). NSAIDs also inhibit mucosal cyclooxygenase, leading to decreased prostaglandin synthesis. This results in ulcers from reduced secretion of protective bicarbonate and mucous, and decreased mucosal blood flow.
Risk Factors for NSAID-induced Peptic Ulcer
- previous peptic ulcers/UGIB
- age (≥65 yr)
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

Treatment
- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol (less effective) in one tablet
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

Stress-Induced Ulceration

Definition
- ulceration or erosion in the upper GI tract of ill patients, usually in ICU (stress is physiological, not psychiatric)
- lesions most commonly in fundus of stomach

Pathophysiology
- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing ulcers
- mechanical ventilation is the most important risk factor

Risk Factors
- mechanical ventilation
- anti-coagulation
- multi-organ failure
- sepsis
- severe surgery/trauma
- CNS injury (“Cu hing’s ulcers”)
- burns involving more than 35% of body surface

Clinical Features
- UGIB (see Upper Gastrointestinal Bleeding, G25)
- painless

Treatment
- prophylaxis with gastric acid suppressants decreases risk of UGIB; PPI most potent but may increase risk of pneumonia; H2 blockers less potent but less likely to cause pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

Gastric Carcinoma
- see General Surgery, GS19

Small and Large Bowel

Classification of Diarrhea

Definition
- clinically: diarrhea defined as stools that are looser and/or more frequent than normal (i.e. ≥3x per day); physiologically: 24 h stool weight >200 g (less useful clinically)

Classification
- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume (>1/2 cup stool; typical of small bowel diseases)
- watery: secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)
- steatorrhea
- inflammatory
- functional

Stool Osmotic Gap

Stool osmolality is normally about 290 mOsm/kg and can be approximated by the calculated stool osmolality

\[ 2 \times [\text{Na}^+]_{\text{stool}} + [\text{K}^+]_{\text{stool}} \]

In osmotic diarrhea, measured stool osmolality > calculated stool osmolality
In secretory diarrhea measured stool osmolality = calculated stool osmolality
Stool osmolality is always the same as serum
### Acute Diarrhea

#### Definition
- passage of frequent unformed stools for <14 d

#### Etiology
- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

#### Risk Factors
- food (raw or undercooked meat and seafood, unpasteurized dairy products)
- medications: antibiotics, laxatives
- others: high risk sexual activity, infectious outbreaks, occupational exposures (daycare workers), family history (IBD)

#### Table 8. Classification of Acute Diarrhea

</tr>
</tbody>
</table>

#### Investigations
- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (day care worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
  - C&S only tests *Campylobacter*, *Salmonella*, *Shigella*, *E. coli*.
  - other organisms must be ordered separately
- flexible sigmoidoscopy (without bowel preparation): useful if inflammatory diarrhea suspected
- biopsies are the most useful method of distinguishing idiopathic IBD (Crohn’s disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
- *C. difficile* toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home, or recent chemotherapy

#### Treatment
- fluid and electrolyte replacement orally in most cases, intravenous if severe extremes of age/coma
- anti-diarrheals
  - antimotility agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
  - side effects: abdominal cramps, toxic megacolon
  - absorbents: kaolin/pectin (Kaopectate®), methylcellulose, activated attapulgite
  - act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
  - much less effective than antimotility agents
  - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful (but should not be used in the presence of bloody diarrhea or fever)
- antibiotics: rarely indicated
  - risks
    - prolonged excretion of enteric pathogen (especially *Salmonella*)
    - drug side effects (including *C. difficile* infection)
    - development of resistant strains
    - renal failure/hemolysis (enteroheamorrhagic *E. coli* O157:H7)

#### Infectious Causes of Inflammatory Diarrhea
- *Yersinia*
- *Shigella*
- *Salmonella*
- *E. coli* (IEC 0157:H7), *E. histolytica*
- *Campylobacter*, *C. difficile*
indications for antimicrobial agents in acute diarrhea
- septicemia
- prolonged fever with fecal blood or leukocytes
- likely indicated: Shigella, V. cholerae, C. difficile, traveller’s diarrhea (enterotoxigenic E. coli [ETEC]), Giardia, Entamoeba histolytica, Cyclospora
- situational: Salmonella, Campylobacter, Yersinia, non-enterotoxigenic E. coli
- Salmonella: always treat Salmonella typhi (typhoid or enteric fever); treat other Salmonella only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

Traveller’s Diarrhea

- see Infectious Diseases, ID13

Chronic Diarrhea

Definition
- passage of frequent unformed stool for >4 wk (persistent diarrhea as 14-30 d)
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

Etiology/Classification
- see Differential Diagnosis of Common Presenting Complaints, G4

Investigations
- guided by history
- stool analysis for: C. difficile toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper Gi endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
- caveat: may delay diagnosis of IBD and celiac disease

Maldigestion and Malabsorption

Definition
- maldigestion: inability to break down large molecules in the lumen of the intestine into their component small molecules
- malabsorption: inability to transport molecules across the intestinal mucosa into circulation

Etiology
- maldigestion
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis, pancreatitis cancer)
  - bile salt deficiency
    - terminal ileal disease (impaired recycling), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. primary biliary cirrhosis)
  - specific enzyme deficiencies (e.g. lactase)
- malabsorption
  - inadequate absorptive surface
  - infections/infestations (e.g. Whipple's disease, Giardia)
  - immunologic or allergic injury (e.g. celiac disease)
  - infiltration (e.g. lymphoma, amyloidosis)
  - fibrosis (e.g. systemic sclerosis, radiation enteritis)
  - bowel resection (length, site, location, presence/absence of ileocecal valve are important)
  - extensive ileal Crohn’s disease
  - drug-induced
    - cholestyramine, ethanol, neomycin, tetracycline, and other antibiotics
  - endocrine
    - DM (complex pathogenesis)

Clinical Features
- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

</tr>
</tbody>
</table>

* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone.

Investigations
- transglutaminase (tTG) antibody serology/immunoglobulin quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase to screen for pancreatic insufficiency and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca<sup>2+</sup>, Mg<sup>2+</sup>, vitamin B12, albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (rarely used)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

Treatment
- dependent on underlying etiology
Celiac Disease (Gluten Enteropathy/Sprue)

Definition
- abnormal small intestine mucosa due to intestinal reaction to gluten, a protein found in wheat, barely, rye, and possibly oats (pure oats likely okay)

Etiology
- only autoimmune disease in which antigen (various gliadin peptides) is recognized
- associated with other autoimmune diseases, especially Sjögren's, thyroid disease
- gluten is broken down to gliadin, which is the toxic factor
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; celiac also associated with HLA DQ8 (note: up to 40% of Caucasians carry the HLA alleles, but will never develop celiac disease)

Epidemiology
- more common in women
- family history: 10-15% of first-degree relatives
- may present any time from infancy (when cereals introduced) to elderly
- peak presentation in infancy

Clinical Features
- classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
- thus iron, calcium, and folic acid deficiency (proximal absorption) more common than vitamin B12 deficiency (absorbed in ileum)
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

Investigations
- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - IgA deficient patients have false-negative anti-tTG
    - therefore, measure serum IgA concomitantly (via serum quantitative protein electrophoresis)
  - incorporate serum testing tTG and/or DGP IgG in IgA deficiencies
- small bowel mucosal biopsy (usually duodenum) is diagnostic with increased intraepithelial lymphocytes (earliest pathologic finding)
  - crypt hyperplasia
  - villous atrophy
  - note: villous atrophy also seen in small bowel overgrowth, Crohn's, lymphoma, Giardia, HIV
  - improvement with a gluten-free diet, but should not be started before serological tests and biopsy
  - consider CT enterography to visualize small bowel to rule out lymphoma
  - evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation, Ca++, Fe, albumin, cholesterol, carotene, B12 absorption
  - fecal fat >7%

Treatment
- dietary counselling
  - gluten free diet; avoid barley, rye, wheat (as these grains are related and also have toxic factor, similar to gliadin)
  - oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
  - if poor response to diet change, consider
    - alternate diagnosis
    - non-adherence to gluten-free diet
  - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  - development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
  - development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

Prognosis
- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight increase compared with general population), autoimmune diseases
- risk of lymphoma may be lowered by dietary gluten restriction
Inflammatory Bowel Disease

Definition
- Crohn's disease (CD), ulcerative colitis (UC), indeterminate colitis or IBD-unclassified (IBDU)

Pathophysiology
- poorly understood
- most likely a sustained response of the immune system, perhaps to enteric flora
- lack of appropriate down-regulation of immune responsiveness after an infection in a genetically predisposed individual

Genetics
- increased risk of both UC and CD in relatives of patients with either disease, especially siblings, early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 9 gene loci are associated
  - CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially Ashkenazi Jews, early onset disease, ileal involvement, fistulizing and stenotic disease
    - CARD15 gene product modulates NFκβ, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

**Crohn’s Disease**

**Definition**
- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region (“gum to bum”)

**Epidemiology**
- incidence 1-6/100,000; prevalence 10-100/100,000
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn’s increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in Crohn’s patients is higher than general population

**Pathology**
- most common location: ileum + ascending colon
- linear ulcers leading to mucosal islands and “cobblestone” appearance
- granulomas are found in 50% of surgical specimens 15% of mucosal biopsies

**Clinical Features**
- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, non-bloody diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- extra-intestinal manifestations are more common with colonic involvement
- fistulæ, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulæ and abscesses)
- enteric fistulæ may communicate with skin, bladder, vagina, and other parts of bowel

**Investigations**
- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, C. difficile toxin to exclude other causes of inflammatory diarrhea
Management (see Figure 7)

Table 12. Management of Crohn’s Disease

<table>
<thead>
<tr>
<th>Management/Diet</th>
<th>Notes</th>
</tr>
</thead>
</table>
| Lifestyle/Diet | Smoking cessation  
Fluids only during acute exacerbation  
Enteral diets may aid in remission only for Crohn’s ileitis, not colitis  
No evidence for any non-enteral diet changing the natural history of Crohn’s disease, but may affect symptoms  
Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vit D, Ca++, Mg++, zinc, Fe, B12)  
5-ASA**  
*5-ASA use in Crohn’s is controversial. However, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response) |
| Antidiarrheal Agents* | Loperamide (Imodium®) > diphenoxylate (Lomotil®) > codeine (cheap but addictive)  
All work by decreasing small bowel motility, used only for symptom relief  
CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups  
5-ASA**  
Efficacy controversial: Is currently used for mild ileitis  
Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine  
Hydrolysis by intestinal bacteria releases 5-ASA (active component)  
Dose-dependent efficacy |
| Antibiotics | e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin  
Immunosuppressives  
Corticosteroids |
| Corticosteroids | Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe  
No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis  
Most commonly used as steroid-sparing agents  
i.e. to lower risk of relapse as corticosteroids are withdrawn  
May require >3 mo to have beneficial effect; usually continued for several years  
May help to heal fistulae, decrease disease activity  
Increases efficacy of biologicals plus lowers chances of biological dosing efficacy (tolerance) so often given in combination with biologics  
Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy (i.e. lymphoma)  
Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α  
Proven effective for treatment of fistulose and patients with medically refractory CD  
First line immunosuppressive therapy with infliximab + azathioprine more effective than using either alone  
Ustekinumab, monoclonal antibody against P40 subunit of interleukin 12 and 23  
Vedolizumab, monoclonal antibody directed against integrin α4β7 thereby reducing lymphocyte traffic to gut-now indicated for UC and Crohn’s |
| Biologics | Induction of Remission  
Maintenance |
| 5-ASA* | ?  
Steroids | + |
| Immunosuppressive | + + |
| Antibiotics | + |
| MTX | + |
| Infliximab | + + |

**Prognosis**
- Highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- Increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- Complications include
  - Intestinal obstruction/perforation
  - Fistula formation
  - Malignancy (lower risk compared to UC)
  - Surveillance colonoscopy same as ulcerative colitis (see Ulcerative Colitis) if more than 1/3 of colon involved

**Ulcerative Colitis**

**Definition**
- Inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

**Epidemiology**
- Incidence 2-10/100,000; prevalence 35-100/100,000 (more common than Crohn’s)
- 2/3 onset by age 30 (with second peak after 50); M:F
- Small hereditary contribution (15% of cases have 1st degree relative with disease)
- Risk is less in smokers
- Inflammation limited to rectum or left colon is more common than pancolitis
**Pathology**
- Disease can involve any portion of the lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis).
- Inflammation is diffuse, continuous, and confined to mucosa.

**Clinical Features**
- Rectal bleeding is the hallmark feature; diarrhea present if more than the rectum is involved.
  - Can also have abdominal cramps/pain, especially with defecation.
  - Severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool).
  - Tenesmus, urgency, incontinence.
  - Systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases.
  - Extra-intestinal manifestations (see Table 11).
  - Characteristic exacerbations and remissions; 5% of cases are fulminant.

**Investigations**
- Sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis.
- Colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation.
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease.
- Stool culture, microscopy, C. difficile toxin assay necessary to exclude infection.
- No single confirmatory test.

**Treatment**
- Mainstays of treatment: 5-ASA (mesalamine) derivatives (only in mild to moderate disease).
- Diet of little value in decreasing inflammation but may alleviate symptoms.
- Anti-diarrheal medications generally not indicated in UC.
- 5-ASA:
  - Topical (suppository or enema): effective for distal disease (rectum to splenic flexure) if inflammation is mild, preferable to corticosteroids.
  - Oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d).
  - Commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%).
  - May decrease rate of colorectal cancer.
- Corticosteroids:
  - To remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h).
  - Limited role as maintenance therapy for mild to moderate disease.
  - Use suppositories for proctitis.
  - Use enemas and topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure.
- Immunosuppressants (steroid-sparing):
  - In hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 days; then colectomy if inadequate response.
  - Biologics (infliximab, adalimumab, golimumab, vedolizumab) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent.
  - Azathioprine and 6-mercaptopurine: too slow to rapidly resolve acute relapse.
  - Most commonly used to maintain remission as corticosteroids withdrawn.
  - Given with biologics: increase efficacy of biologics and decrease likelihood of tolerance to biologics (~ 10% chance/yr).
- Surgical treatment curative:
  - Aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA).
  - Indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy.

**Complications**
- Similar to CD, except:
  - More liver problems (especially PSC in men).
  - Greater risk of colorectal cancer.
  - Risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%).
  - Risk also increases with active mucosal inflammation and sclerosing cholangitis.
  - Thus, regular colonoscopy and biopsy in pancolitis of ≥8 yr is indicated.
  - Toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see General Surgery, GS37).

**Immunosuppressive ± +**
- Steroids +
- 5-ASA + +
- Azathioprine and 6-mercaptopurine
- Biologics (infliximab, adalimumab, golimumab, vedolizumab) can also be used for outpatients with severe UC – add IV infliximab if no response to IV methylprednisolone.

**Medical Management of Ulcerative Colitis**

<table>
<thead>

</tbody>
</table>

When considering complications of IBD, think:

**Ulcerative Colitis**
- Urinary calculi
- Liver problems
- Epithelial problems
- Retardation of growth/sexual maturation
- Arthritis
- Thrombophlebitis
- Isotopic complications
- Vitamin deficiencies
- Eyes
- Colorectal cancer
- Obstruction
- Leakage (perforation)
- Iron deficiency
- Toxic megacolon
- Infection (wasting)
- Strictures
Prognosis
- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- >1 attack in almost all patients
- more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
  - colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course
- stool calprotectin increasingly recognized as a marker of bowel mucosal inflammation, reported especially to be useful in monitoring the activity of inflammatory bowel disease, but accuracy is still controversial

Irritable Bowel Syndrome

Definition
- a form of functional bowel disease; more than just a label for GI symptoms unexplained after normal investigations

Epidemiology
- 20% of North Americans
- onset of symptoms usually in young adulthood
- F>M

Pathophysiology
- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associations or if causative
- psychological: stress may increase IBS symptoms but probably does not cause IBS
- types of IBS: IBS with diarrhea, IBS with constipation, IBS-mixed type (both diarrhea and constipation), and IBS untyped (insufficient abnormality in stool consistency to meet other types)

Diagnosis

Table 13. Rome IV Criteria for Diagnosing Irritable Bowel Syndrome

<table>
<thead>
<tr>
<th>IBS Rome IV Criteria</th>
<th>Recurrent abdominal pain, on average, at least 1 day per week in the last 3 months, associated with 2 or more of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. Related to defecation</td>

</tr>
</thead>
<tbody>
<tr>
<td>Fever</td>
<td>Blood or pus in stool</td>
</tr>
<tr>
<td>Nocturnal defecation</td>
<td>Abnormal gross findings on flexible sigmoidoscopy</td>
</tr>
</tbody>
</table>

Investigations
- if history consistent with Rome IV criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
- investigations can be limited to CBC, inflammatory markers (ESR, CRP) and celiac serology
- if available, fecal calprotectin is likely more reliable test to rule out IBD
- consider TSH, stool cultures depending on clinical circumstances
- consider colonoscopy (e.g. if alarming features present, family history of IBD or age >50)

Treatment
- reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction, probably exercise
- low FODMAP diet for pain, bloating gas, irregular bowel movements
- no therapeutic agent consistently effective, pain most difficult to control, no drug changes natural history so the drug should be “wanted, since it is not needed”
Symptoms of IBS can be symptom-guided treatment. Pain predominant can be treated with antispasmodic medication before meals (e.g., hyoscine, pinaverium, trimebutine - low level evidence). Tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI - moderate level of evidence).

- **IBS with diarrhea (IBS-D)**: To increase stool consistency, dietary fibre (bran or psyllium) is recommended, but it may worsen abdominal gas. Loperamide (Imodium®), diphenoxylate (Lomotil®), and cholestyramine can be used.

- **IBS with constipation (IBS-C)**: To increase fibre in diet, linaclotide, osmotic or other laxatives (help more with constipation than pain), and mixed (alternating constipation and diarrhea) (IBS-M)

**Prognosis**
- 80% improve over time
- Most have intermittent episodes
- Normal life expectancy

**Constipation**

**Definition**
- Passage of infrequent or hard stools with straining (stool water <50 mL/d); bowel frequency <3x/wk

**Epidemiology**
- Increasing prevalence with age; F>M
- Rare in Africa and India where stool weight is 3-4x greater than in Western countries

**Etiology**
- Most common: idiopathic attributed to colon dysmotility but this is difficult to measure
- Organic causes
  - Medication side effects (narcotics, antidepressants) are the most common
  - Intestinal obstruction, left-sided colon cancer (consider in older patients), and fecal impaction
- Metabolic
  - DM
  - Hypothyroidism
  - Hypercalcemia, hypokalemia, uremia
- Neurological
  - Intestinal pseudo-obstruction
  - Parkinson’s disease
  - MS
  - Collagen vascular disease (e.g., scleroderma)
  - Painful anal conditions (e.g., fissures)

**Clinical Presentation**
- Overlaps with IBS
- Stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

**Investigations**
- Underlying disease rarely found if constipation is the only presenting symptom
  - Only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, and glucose, X-ray of abdomen
  - Colon visualization if concomitant symptoms such as rectal bleeding, weight loss, or anemia (colonoscopy, CT colonography)
  - If refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque markers that are ingested and followed with a series of plain film abdominal x-rays (normal: 70 h)
  1. Normal = misperception of normal defecation (IBS)
  2. Prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  3. Outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- Combination of 1 and 3 common
Treatment (in order of Increasing Potency)
• dietary fibre
  ▪ useful if mild or moderate constipation, but not if severe
  ▪ aim for 30 g daily, increase dose slowly
• surface-acting (soften and lubricate)
  ▪ docusate salts, mineral oils
• osmotic agents (effective in 2-3 d)
  ▪ lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol (β-galactosido-sorbitol), polyethylene glycol 3350
• cathartics/stimulants (effective in 24 h)
  ▪ castor oil, senna (avoid prolonged use to prevent melanosi... infusion of 50 µg/h
• prokinetic agents (prucalopride)
• linaclotide (increases water secretion into the intestinal lumen)

Upper Gastrointestinal Bleeding

Definition
• bleeding proximal to the ligament of Treitz, see Gastrointestinal Tract, G2 (75% of GI bleeds)
  ▪ ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

Etiology
• above the GE junction
  ▪ epistaxis
  ▪ esophageal varices (10-30%)
  ▪ esophagitis
  ▪ esophageal cancer
  ▪ Mallory-Weiss tear (10%)
• stomach
  ▪ gastric ulcer (20%) (see Peptic Ulcer Disease, G11)
  ▪ erosive gastritis (e.g. from EtOH or post-surgery) (20%)
  ▪ gastric cancer
  ▪ gastric antral vascular ectasia (rare, associated with cirrhosis and CTD)
  ▪ Dieulafoy’s lesion (very rare)
• duodenum
  ▪ ulcer in bulb (25%)
  ▪ aortoenteric fistula: usually only if previous aortic graft (see sidebar)
• coagulopathy (drugs, renal disease, liver disease)
• vascular malformation (Dieulafoy’s lesion, AVM)

Clinical Features
• in order of decreasing severity of the bleed: hematochezia (brisk upper GI bleed) > hematemesis > coffee ground emesis > melena > occult blood in stool

Treatment
• stabilize patient (1-2 large bore IVs, IV fluids, monitor)
• send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
• keep NPO
• consider NG tube to determine upper vs. lower GI bleeding in some cases
• IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  ▪ given to stabilize clot, not to accelerate ulcer healing
  ▪ if given before endoscopy, decreases need for endoscopic therapeutic intervention
• for variceal bleeds, octreotide 50 µg loading dose followed by constant infusion of 50 µg/h
• consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach
• endoscopy (OGD): establish bleeding site + treat lesion
  ▪ if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  ▪ endoclips
  ▪ hemoacrylate
  ▪ hemospray

Prognosis
• 80% stop spontaneously
• peptic ulcer bleeding: lower mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
• endoscopic predictors of rebleeding (Forrest classification): spurt or ooze, visible vessel, fibrin clot
• can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no high risk predictors of rebleeding
• H2-antagonists should not be used since they impact minimally on rebleeding rates and need for surgery
• esophageal varices have a high rebleeding rate (55%) and mortality (29%)

Lancet 1974;2:394-397
**Esophageal Varices**

**Etiology**
almost always due to portal hypertension

**Clinical Features**
- characteristically massive upper GI bleeding

**Prognosis**
- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

**Investigations**
- endoscopy

**Management**

1. Assess hemodynamic stability and resuscitate*

2. IV octreotide
   - Causes splanchnic vasoconstriction
   - Decreases portal collateral circulation and pressure

3. Endoscopic therapy: variceal ligation (EVL) or sclerotherapy

**Long-term treatment to decrease risk of recurrent bleed**
- β-blocker (e.g. nadolol)
- Repeat EVL/sclerotherapy
- Nitrates
- Follow-up

**PERSISTENT or RECURRENT bleed – treatment options**
- Transjugular intrahepatic portosystemic shunt (TIPS)
- Balloon tamponade
- Live transplant

*MIV c ftri xone lowers risk of sepsis, especially spontaneous bacterial peritonitis

---

**Mallory-Weiss Tear**

**Definition**
- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

**Etiology**
- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present

**Clinical Features**
- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

**Management**
- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair

---

* Wireless endoscopy capsule results help double balloon endoscopy localize source of bleeding
* Angiography if overt bleeding hemodynamically significant, estimated >0.5 cc/min
* CT enterography if wireless endoscopy capsule/double balloon endoscopy not available
Lower Gastrointestinal Bleeding

Definition
• bleed distal to ligament of Treitz

Etiology
• if blood per rectum with hemodynamic instability, rule out upper GI source
• diverticular (60% from right colon)
• vascular
  ■ angiodysplasia (small vascular malformations of the gut)
  ■ anorectal (hemorrhoids, fissures)
• neoplasm
  ■ cancer
  ■ polyps
• inflammation
  ■ colitis (ulcerative, infectious, radiation, ischemic)
  ■ post-polypectomy

Clinical Features
• hematochezia
• anemia
• occult blood in stool
• rarely melena

Treatment
• treat underlying cause

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Serum Bilirubin
  * canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut
  * direct bilirubin = conjugated; indirect = unconjugated bilirubin

B. Tests of Liver Injury

- disproportionately increased AST or ALT = hepatocellular damage
  - ALT more specific to liver; AST from multiple sources (especially muscle)
  - elevation of both highly suggestive of liver injury
  - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP (and GGT) = cholestasis (stasis of bile flow)
  - if ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT
  - if ALP elevation out of proportion to ALT/AST elevation, consider
    1. obstruction of common bile duct (e.g. extraluminal = pancreatic Ca, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
    2. destruction of microscopic ducts (e.g. PBC)
    3. bile acid transporter defects (e.g. drugs, intrahepatic cholestasis of pregnancy)
    4. infiltration of the liver (e.g. liver metastases, lymphoma, granulomas, amyloid)

Acute Viral Hepatitis (General)

Definition
- viral hepatitis lasting <6 mo

Clinical Features
- most are subclinical
  - flu-like prodrome may precede jaundice by 1-2 wk
    - nausea/vomiting, anorexia, headaches, fatigue, myalgia, low-grade fever, arthralgia and urticaria (especially HBV)
  - only some progress to icteric (clinical jaundice) phase, lasting days to weeks
    - pale stools and dark urine 1-5 d prior to icteric phase
    - hepatomegaly and RUQ pain
    - splenomegaly and cervical lymphadenopathy (10-20% of cases)

Investigations
- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly the IgM antibody directed to the virus

Treatment
- supportive (hydration  diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with entecavir should be considered; in anicteric hepatitis C, anti-viral treatment should be considered (see hepatitis C)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

Prognosis
- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia
Complications
• cholestasis (most commonly associated with HAV infection)
• hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

Hepatitis A Virus

• RNA virus
• fecal-oral transmission; incubation period 4-6 wk
• diagnosed by elevated transaminases, positive anti-HAV IgM
• in children: characteristically asymptomatic
• can cause acute liver failure and subsequent death (<1-5%)
• can relapse (rarely), but never becomes chronic

Figure 11. Time course of acute hepatitis B infection

Epidemiology
• 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  1. immune tolerance: extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or ‘incubation period’ in adult with newly-acquired HBV)
  2. immune clearance (or immunoactive): HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment
  3. immune control: lower HBV-DNA (<20,000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  4. immune escape (“core or precore mutant”): elevated HBV-DNA (>2,000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

DDx for Hepatitis
• Viral infection
• Alcohol
• Drugs
• Immune-mediated
• Toxins

Causes of Elevated Serum Transaminases in Chronic Hepatitis B
• Ongoing immune-mediated liver injury without immune control of HBV (HBeAg positive)
• Immune escape (anti-HBe positive)
• Reactivation, seroconversion (conversion from anti-HBe to HBeAg)
• Hepatitis D
• Hepatocellular carcinoma
• Other liver insult (fatty liver, alcohol, drugs, hepatitis A)

Risk Factors for Progression
• EtOH
• HIV coinfection
• Old age at diagnosis

In acute hepatitis B, HDV coinfection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis

Risk of hepatocellular carcinoma in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis, and serum HBV-DNA
Risk of hepatocellular carcinoma in HCV increases only after cirrhosis develops

Without treatment, 8-20% of those with ongoing immunoactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury

HCV (and HBV) treatment lowers the risk of hepatocellular carcinoma
Hepatitis D

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than hepatitis B virus alone
- coinfection: acquire HDV and HBV at the same time
- HDV can present as ALF and/or accelerate progression to cirrhosis
- treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

Hepatitis C Virus

- RNA virus (7 genotypes; genotype 1 is most common in North America)
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factors: injection drug use
- other risk factors: blood transfusion received before 1990 (or received in developing world), tattoos, intranasal cocaine use
- clinical manifestation develops 6-8 wk after exposure
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

Diagnosis

- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- virus genotype correlates with response to treatment but not prognosis
- serum HCV-RNA inversely correlates with response to treatment
- normal transaminases may have underlying cirrhosis on biopsy, but otherwise excellent prognosis

Treatment

- blood-borne precautions; vaccine for hepatitis A and B if serology negative; avoid alcohol
- clearest indication for treatment is in subgroup likely to develop clinically significant liver disease, i.e., persistently elevated transaminases, liver biopsy showing fibrosis/cirrhosis, and at least moderately severe necrosis/inflammation
- treatment depends partly on genotype; length of treatment depends on degree of fibrosis, level of serum HCV-RNA, comorbidities, and previous treatment
- oral interferon-free regimens (for all genotypes) (e.g., sofosbuvir/ledipasvir, ombitasvir/paritaprevir/ritonavir+dasabuvir, or elbasvir/grazoprevir and sofosbuvir/velpatasvir) are now the standard of care with >90% success rate without significant side-effects including those who failed previous interferon-based treatment

Prognosis

- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- risk of hepatocellular carcinoma increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

</tbody>
</table>

Autoimmune Liver Disease

- diagnosis of exclusion: rule out viruses, drugs/alcohol, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrhepatic manifestations
  - sicca, Raynauds, thyroiditis, Sjögrens, arthralgias
  - hypergammaglobulinemia (particularly elevated IgG)
  - anti-smooth muscle antibody elevation is most characteristic
  - anti-LKM elevation (liver kidney microsome), especially in children
  - less specific: elevated ANA, RF
  - can have false positive viral serology (especially anti-HCV)
  - biopsy – periporal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)

- many different patterns of liver injury (i.e. hepatocellular, cholestatic, mixed, granulomatous, acute liver failure) can be seen in drug-induced liver injury and thus this requires a high index of suspicion.
- see: LiverTox for Information regarding drug-specific risks and patterns of hepatotoxicity (http://livertox.nih.gov)

#### Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause ALF (transaminases >1,000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite is formed → covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: N/V (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
  - note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emesis (if <2 h after ingestion)
    - oral activated charcoal
    - N-acetylcysteine (NAC, Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
    - promotes hepatic glutathione regeneration
    - no recorded fatal outcomes if NAC given before increase in transaminases
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- INH (isoniazid)
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- methotrexate
  - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methyldopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

#### Wilson’s Disease

**Definition**
- autosomal recessive defect in copper metabolism (gene ATP7B)

**Etiology**
- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin

**Clinical Features**
- liver: acute hepatitis, acute liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
- eyes: Kayser-Fleischer rings (copper deposits in Descemet’s membrane); more common in patients with CNS involvement, present in 50% if only liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi’s syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

**Clinical Manifestations of Wilson’s Disease**

<td>Dementia</td>
</tr>
</tbody>
</table>
**Investigations**
- suspect if increased liver enzymes with clinical manifestations at young age (<30); especially combination of liver disease with dystonia, psychiatric symptoms
- screening tests
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion
- gold standard
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in ATP7B are possible

**Treatment**
- 4 drugs available
  1. penicillamine chelates copper, poorly tolerated
  2. trientine chelates copper
  3. zinc impairs copper excretion in stool and decreases copper absorption from gut
  4. tetrathiomolybdate preferred if neurological involvement
- screen relatives
- liver transplant in severe cases

---

**Hemochromatosis**

**Definition**
- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20–40 g (normal 1 g)

**Etiology**
- primary (hereditary) hemochromatosis
  - hepcidin deficiency results in ongoing gut absorption of iron despite adequate iron stores
- secondary hemochromatosis
  - parental iron overload (e.g. transfusions)
  - chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency
  - excessive iron intake

**Epidemiology**
- hereditary hemochromatosis most common in Northern European descent
- primarily due to common recessive gene (HFE, 5%); 1/400 patients are homozygotes

**Clinical Features**
- usually presents with trivial elevation in serum transaminases
- liver: cirrhosis (30%), HCC (200x increased risk) - most common cause of death (1/3 of patients)
- pancreas: DM, chronic pancreatitis
- skin: bronze or grey (due to melanin, not iron)
- heart: dilated cardiomyopathy
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis

**Investigations**
- screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease)
  - transferrin saturation (free Fe²⁺/TIBC) >45%
  - serum ferritin >400 ng/mL
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
  - liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
    - markers of advanced fibrosis if any of the following are present at the time of diagnosis → age >40, elevated liver enzymes, or ferritin >1000
    - considered if compound heterozygote and potential other cause of liver injury (e.g. fatty liver, etc.)
    - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
  - HCC screening if cirrhosis

**Treatment**
- phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

**Prognosis**
- normal life expectancy if treated before the development of cirrhosis or DM
Alcoholic Liver Disease

Definition
- spectrum of diseases, ranging from:
  - fatty liver (all alc.): always reversible if alcohol stopped
  - alcoholic hepatitis (35% of alc.): usually reversible if alcohol stopped
  - cirrhosis (10-15% of alc.): potentially irreversible

Pathophysiology
- several mechanisms, poorly understood
  - ethanol oxidation to acetaldehyde
    - reduces NAD+ to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
    - binds to hepatocytes evoking an immune reaction
  - ethanol increases gut permeability leading to increased bacterial translocation
  - alcohol metabolism causes
    - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
    - necrosis and hepatic vein sclerosis
  - histology of alcoholic hepatitis
    - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
    - large fat globules
    - fibrosis: space of Disse and perivenular

Clinical Features
- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
  - fatty liver
    - mildly tender hepatomegaly; jaundice rare
    - mildly increased transaminases <5x normal
  - alcoholic hepatitis
    - variable severity: mild to fatal liver failure
    - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice, and mildly elevated INR)
    - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

Investigations
- blood tests are non-specific, but in general
  - AST:ALT >2:1 (both usually <300)
  - CBC: increased MCV, increased WBC often seen with alcoholic hepatitis but not necessarily in other alcohol-related liver injury.
  - Increased GGT

Treatment
- alcohol cessation (see Psychiatry, PS23)
  - Alcoholics Anonymous, disulfiram, naltrexone, acamprosate
  - multivitamin supplements (especially thiamine)
  - caution with drugs metabolized by the liver
  - prednisone and pentoxifylline less used since most definitive trial did not show efficacy

Prognosis
- Maddrey’s discriminant function (based on PT and bilirubin) and MELD predict mortality and guide treatment (consideration for corticosteroids for severe disease based on Maddrey ≥ 32 or MELD ≥21)
  - fatty liver: complete resolution with cessation of alcohol intake
  - alcoholic hepatitis mortality
    - immediate: 30%-60% in the first 6 mo if severe
    - with continued alcohol: 70% in 5 yr
    - with cessation: 30% in 5 yr

Standard Drink Equivalent
- 1 standard drink = 14 g EtOH
  - 12 oz beer (5% alcohol)
  - 5 oz wine (12-17%)
  - 3 oz fortified wine (17-22%)
  - 1.5 oz liquor (40%)
**Non-Alcoholic Fatty Liver Disease**

**Definition**
- spectrum of disorders characterized by macrovesicular hepatic steatosis, sometimes with inflammation and/or fibrosis
- most common cause of liver disease in North America

**Etiology**
- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- histological changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

**Risk Factors**
- likely a component of the metabolic syndrome along with type 2 DM, HTN, hypertriglyceridemia
- rapid weight loss or weight gain

**Clinical Features**
- often asymptomatic
- may present with fatigue, malaise, and vague RUQ discomfort
- elevated serum triglyceride/cholesterol levels and insulin resistance

**Investigations**
- elevated serum AST, ALT ± ALP; AST/ALT <1
- presents as echogenic liver texture on ultrasound
- liver biopsy diagnostic, but often necessary only for prognosis

**Treatment**
- mainstay is gradual weight loss (0.5-1 kg/wk) as rapid weight loss can worsen liver disease
  - ideally, aim to lose at least 7-10% of body weight
  - some evidence for vitamin E (800 U daily) if there is hepatic inflammation
  - some evidence for benefits of coffee drinking (3 cups per day) and vitamin D

**Prognosis**
- most die from cardiovascular or cerebrovascular disease
- better prognosis than alcoholic hepatitis
  - <25% progress to cirrhosis over a 7-10yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavourable prognosis: DM, age, metabolic syndrome

**Acute Liver Failure (formerly Fulminant Hepatic Failure)**

**Definition**
- severe decline in liver function characterized by coagulation abnormality (INR>1.5) and encephalopathy
- in setting of previously normal liver
- rapid (<26 wk duration)

**Etiology**
- drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

**Treatment**
- correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value of biopsy is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), age <10 or >40, cause is drug or unknown, bilirubin >300 µmol/L, INR >3.5, creatinine >200 µmol/L
Cirrhosis

Definition
- liver damage characterized by diffuse distortion of the basic architecture and replacement with scar tissue and formation of regenerative nodules
- Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
- Stage 2 cirrhosis is decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy, characteristically presents abruptly even though histologically the liver fibrosis is gradually progressive

Etiology
- fatty liver (alcoholic or non-alcoholic fatty liver disease)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- hemochromatosis
- primary biliary cirrhosis
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent "burnt-out NASH")
- rare Wilson’s disease, Gaucher’s disease, α1-antitrypsin deficiency

Investigations
- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work: fall in platelet count <150 is the earliest finding, followed many years later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event)
  - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - U/S is the primary imaging modality but only finds advanced cirrhosis
    - CT to look for varices, nodular liver texture, splenomegaly
  - Transient Ultrasound Elastography (Fibroscan®): non-invasive tool using elastography (variable availability) for measuring liver compliance
  - rapidly replacing liver biopsy to determine extent of liver fibrosis and make the diagnosis of cirrhosis
- gastroscopy: varices or portal hypertensive gastropathy

Treatment
- treat underlying disorder
- decrease insults (e.g. alcohol cessation, hepatotoxic drugs, immunize for Hep A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease if no alcohol for >6 mo; use MELD score

Table 18. Child-Pugh Score and Interpretation

Score: 5-6 (Child’s A), 7-9 (Child’s B), 10-15 (Child’s C)
*Note: Child’s classification is rarely used for shunting (TIPS or other surgical shunts), but is still useful to quantitate the severity of cirrhosis

Complications
- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds

MELD-Na (Model for End Stage Liver Disease)
- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, total bilirubin, and serum sodium concentration

Figure 12. Progression of liver dysfunction based on liver function tests – the “W”
Half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%. Hepatic venous pressure gradient (HVPG) ≥10 mmHg is the strongest predictor of variceal development. Treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, Transjugular Intrahepatic Portosystemic Shunt (TIPS).

Renal failure in cirrhosis
- Classifications
  - Pre-renal (usually due to over-diuresis)
  - Acute tubular necrosis
  - Hepatorenal Syndrome (HRS)
    - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
    - Type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
  - HRS can occur at any time in severe liver disease, especially after
    - Overdiuresis or dehydration, such as diarrhea, vomiting, etc.
    - GI bleed
    - Sepsis
  - Treatment for hepatorenal syndrome (generally unsuccessful at improving long-term survival)
    - For type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
    - Definitive treatment is liver transplant

Hepatopulmonary syndrome
- Majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal HTN
- Thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
- Clinical features
  - Hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary systemic resistance (int apulmonary shunting)
  - Dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
  - Diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
  - Only proven treatment is liver transplantation

Hepatocellular Carcinoma
- See General Surgery, GS44

Liver Transplantation
- See General Surgery, GS45

Portal Hypertension

Definition
- Pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

Pathophysiology
- 3 sites of increased resistance (remember pressure = flow x resistance)
  - Pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - Sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - Post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)
Complications
- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

Treatment
- non-selective β-blockers (propanolol, nadolol, carvedilol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
  - radiologically inserted stent between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction, uncontrolled hepatic encephalopathy, and congestive heart failure
  - most commonly used as a “bridge” to liver transplant
- other surgically created shunts: portacaval, distal spleno-renal (Warren shunt) - all used only rarely in the modern era

Hepatic Encephalopathy

Definition
- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

Pathophysiology
- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

Precipitating Factors
- nitrogen load (GI bleed, protein load from food intake renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

Stages
- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar response (upgoing Babinski)
- IV: coma (response to painful stimuli only)

Investigations
- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia hypoglycemia)
  - characteristic EEG findings: diffuse (non-focal) slow, high amplitude waves serum ammonia levels increased, but not often necessary to measure in routine clinical use

Treatment
- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - routine protein restriction is no longer recommended given patients generally have concurrent malnutrition and muscle wasting; however, vegetable protein is better tolerated than animal protein
  - lactulose: titrated to achieve 2-3 soft stools/d
    - prevents diffusion of NH₃ (ammonia) from the colon into blood by lowering pH and forming non-diffusible NH₄ (ammonium)
    - serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - also acts as a laxative to eliminate nitrogen-producing bacteria from colon
  - oral rifaximin for both acute treatment and maintenance therapy has high level evidence for efficacy
  - best acute treatment in comatose patient is lactulose enemas
**Ascites**

**Definition**
- accumulation of excess fluid in the peritoneal cavity

**Etiology**

<table>
<thead>
<tr>
<th>Serum (Alb) – Ascitic (Alb) &gt; 11 g/L (1.1 g/dL)</th>

<td>Serositis</td>
</tr>
<tr>
<td>Nephrotic syndrome*</td>
<td></td>
</tr>
</tbody>
</table>

* In nephrotic syndrome: decreased serum (Alb) to begin with therefore gradient not helpful

**Pathophysiology**
- Key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  - Underfill hypothesis: first step in ascites formation is increased portal pressure and low oncotic pressure (e.g., low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney
  - Overfill hypothesis: cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily
  - Peripheral arterial vasodilation theory (most popular): as portal HTN develops in cirrhosis, production of local mediators such as nitric oxide lead to splanchnic arterial vasodilation which ultimately results in reduction of effective arterial volume and compensatory sodium and fluid retention by the kidneys (i.e., circulation volume is increased, as per overflow hypothesis, but relatively underfilled, as per underfill hypothesis)

**Diagnosis**
- Abdominal ultrasound
- Physical exam (clinically detectable when > 500 mL)
  - Bulging flanks, shifting dullness, fluid-wave test positive
  - Most sensitive symptom: ankle swelling

**Investigations**
- Diagnostic paracentesis
  - 1st aliquot: cell count and differential
  - 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chylous ascites)
  - 3rd aliquot: C&S, Gram stain
  - 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

**Treatment**
- Non-refractory ascites
  - Na+ restriction (daily sodium intake < 2 g)
  - Diuretics: spironolactone, furosemide
  - Aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  - If target weight loss is not achieved and there are no complications, increase dose to achieve target while monitoring for complications
- Refractory ascites (diuretics are inadequate or not tolerated)
  - Therapeutic paracentesis with intravenous albumin
  - TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
  - Liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis is associated with 50% 2 yr mortality
Complication: Primary/Spontaneous Bacterial Peritonitis
- primary/spontaneous bacterial peritonitis (SBP)
  - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: E. coli (most common), Streptococcus, Klebsiella
  - diagnosis
    - absolute neutrophil count in peritoneal fluid >0.25x10^9 cells/L (250 cells/mm^3)
    - Gram stain positive in only 10-50% of patients
    - culture positive in <80% of patients (not needed for diagnosis)
  - prophylaxis: consider in patients with
    - cirrhosis or GI bleed: ceftriaxone IV daily or norfloxacin bid x 7 d
    - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
  - treatment
    - IV antibiotics (cefotaxime 2 g IV q8h or ceftriaxone 2 g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
    - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

Biliary Tract

Jaundice
- see Table 2 and Figures 14 and 15

Signs and Symptoms
- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer, although most patients with pancreatic cancer have pain
- kernicterus: rarely seen in adults due to maturation of blood brain barrier

Investigations
- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- direct bile duct visualization
- magnetic resonance cholangiopancreatography (MRCP): non-invasive
- endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumours
- endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
- percutaneous transhepatic cholangiography (PTC): if ERCP fails (endoscopic access not possible)

Jaundice (↑ serum bilirubin)
- Fractionate bilirubin
  - Primarily unconjugated
    - Hemolysis
    - Gilbert’s syndrome
  - Primarily conjugated
    - Hepatocellular disease
      - Drugs
      - Alcohol
      - Virus
      - Autoimmune
      - Hemochromatosis
      - Wilson’s disease, etc.
    - Hematobiliary disease
      - Abdominal ultrasound
        - Bile duct normal
        - Bile duct dilated
        - Bile duct obstruction
          - Visualize bile duct
            - Endoscopic bile duct decompression not likely to be necessary
              - MRCP
            - Endoscopic bile duct decompression likely to be necessary
              - ERCP
      - Biliary excretion into duodenum
        - Intestinal flora
        - Urobilinogen: 70-85%
        - Stercobilinogen: 10% excreted via urine
      - Liver
        - Glucuronyl transferase conjugates bilirubin
        - Biliubin (unconjugated)
          - Alb
          - Bilirubin – Alb
        - Biliubin (conjugated)
          - Hb → Globin
          - Heme → Conversion

Figure 14. Approach to jaundice
Figure 15. Production and excretion of bilirubin
Gilbert’s Syndrome

Definition
- mild decrease in glucuronyltransferase activity leading to defective conjugation of bilirubin
- an abnormality of bilirubin metabolism with no clinical relevance

Etiology/Epidemiology
- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

Clinical Features
- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

Treatment
- none indicated (entirely benign)

Primary Sclerosing Cholangitis

Definition
- narrowing of biliary tree (intra and/or extrahepatic bile ducts) from scarring

Etiology
- primary/idiopathic (most common)
  - associated with IBD, more commonly UC, in up to 70% of patients (usually male)
  - one of the most common indications for liver transplant
- secondary (less common)
  - long-term choledocholithiasis
  - cholangiocarcinoma
  - surgical/traumatic injury (iatrogenic)
  - contiguous inflammatory process
  - post-ERCP
  - associated with HIV/AIDS (“HIV cholangiopathy”)
  - IgG4-related disease

Signs and Symptoms
- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

Investigations
- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)
- MRCP and ERCP shows narrowing and dilatations of bile ducts that may result in “beading”, both intrahepatic and extrahepatic bile ducts
  - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

Complications
- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%) difficult to diagnose and treat

Treatment
- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
- endoscopic sphincterotomy, biliary stent in selected cases of dominant CBD stricture
- antibiotics for cholangitis
- suppurative cholangitis requires emergency drainage of pus in CBD
- liver transplantation appears to be the best treatment for advanced sclerosing cholangitis (nearly 90% 1 yr survival; mean follow-up time from diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

Prognosis
- unfavourable regardless of treatment
- mean survival after diagnosis remains 4-10 yr
Primary Biliary Cholangitis (formerly cirrhosis)

**Definition**
- chronic inflammation and fibrous obliteration of intrahepatic bile ductules

**Etiology/Epidemiology**
- likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome, RA, thyroiditis)
- affects mainly middle-aged women (M:F = 1:9)

**Signs and Symptoms**
- often asymptomatic
- initial symptoms: pruritus, fatigue
- chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
- end-stage: hepatocellular failure, portal HTN, ascites
- high incidence of osteoporosis

**Investigations**
- increased ALP, GGT; bilirubin rises in later stage
- positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
- elevated IgM
- increased serum cholesterol (mild increase in LDL, larger increase in HDL)
- may have: xanthelasmata, xanthomas
- liver biopsy confirms diagnosis and stages severity
- normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
- recently described “overlap” syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis

**Treatment**
- drugs that treat the underlying disease:
  - ursodiol (usual first line treatment)
  - obeticholic acid (particularly if inadequate response to urosioli)
  - cholestyramine (for pruritus and hypercholesterolemia)
  - calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
  - monitor for thyroid disease
  - liver transplant if disease severe, progressive

**Prognosis**
- can be fatal, although not all asymptomatic patients show progression

Secondary Biliary Cirrhosis

**Definition**
- cirrhosis from prolonged partial or total obstruction of major bile ducts

**Etiology**
- acquired: post-operative strictures, chronic pancreatitis, sclerosing cholangitis, stone in bile duct
- congenital: CF, congenital biliary atresia, choledochal cysts

**Investigations**
- cholangiography and liver biopsy

**Treatment**
- treat obstruction, give antibiotics for cholangitis prophylaxis

Biliary Colic, Cholecystitis

- see General Surgery, GS47
Ascending Cholangitis

- see Gene al Surgery, GS49

**Definition**
- infection of the biliary tree

**Etiology**
- stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
- infection originates in the duodenum or spreads hematogenously from the portal vein
- bacteria
  - *E. coli, Klebsiella, Enterobacter, Enterococcus*
  - co-infection with *Bacteroides* and *Clostridia* can occur

**Signs and Symptoms**
- Charcot's triad: fever, RUQ pain, jaundice (50-70%)
- Reynolds' Pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

**Investigations**
- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated
- blood culture
- abdominal U/S: CBD dilation, stones

**Treatment**
- most important is drainage, ideally via ERCP, but if not possible technically by percutaneous biliary or least often by surgical routes
- antibiotic therapy: broad spectrum to cover Gram-negatives, Enterococcus, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  - ampicillin + sulbactam or piperacillin/tazobactam
  - metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  - carbapenem monotherapy (e.g. imipenem or meropenem)

**Prognosis**
- good with effective drainage and antibiotics in mild to moderate cases
- high mortality (~50%) in patients with Reynolds Pentad

---

Pancreas

**Pancreatic Enzyme Abnormalities**

**Causes of Increased Serum Amylase**
- pancreatic disease
  - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
  - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
  - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  - macroamylasemia

**Causes of Increased Serum Lipase**
- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
  - macrolipasemia
  - renal failure
**Acute Pancreatitis**

**Etiology** (most common are alcohol and gallstones)

- Idiopathic: thought to be hypertensive sphincter or microlithiasis
- Gallstones (45%)
- Ethanol (35%)
- Tumours: pancreas, ampulla, choledochocele
- Scorpion stings

**Microbiological**
- Bacterial: *Mycoplasma, Campylobacter, TB, M. avium intracellulare, Legionella, leptospirosis*
- Viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
- Parasites: ascariasis, clonorchiasis, echinococcosis

**Autoimmune:** SLE, polyarteritis nodosa (PAN), Crohn’s disease

**Surgery/trauma**
- Manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer

**Hyperlipidemia** (TG >11.3 mmol/L; >1000 mg/dL), Hypercalcemia, Hypothermia

**Emboli or ischemia**

**Drugs/toxins**
- Azathioprine, mercaptopurine, furosemide, estrogens, methyldopa, H2-blockers, valproic acid
- Antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

**Pathophysiology**
- Activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- In gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- In ethanol-related pancreatitis, pathogenesis is unknown
- In rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

**Pathology**
- Mild (interstitial)
  - Per-pancreatic fat necrosis
  - Interstitial edema
- Severe (necrotic)
  - Extensive peri-pancreatic and intra-pancreatic fat necrosis
  - Parenchymal necrosis and hemorrhage → infection in 60%
  - Release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
- Severity of clinical features may not always correlate with pathology
- 3 phases
  - Local inflammation + necrosis → hypovolemia
  - Systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
  - Local complications two weeks after presentation → pancreatic sepsis/abscess

**Signs and Symptoms**
- Pain: epigastric, non-colicky, constant
- Jaundice: compression or obstruction of bile duct
- Can radiate to back
- May improve when leaning forward (Inglefinger’s sign)
- Tetany: transient hypocalcemia
- Tender rigid abdomen; guarding
- N/V
- Abdominal distention from paralytic ileus
- Fever: chemical, not due to infection
- Cullen’s/Grey-Turner’s signs
- Hypovolemic shock: can lead to renal failure
- Acute respiratory distress syndrome
- Coma

**Investigations**
- Increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- Increased WBC, glucose, low calcium
- Imaging: CT most useful for diagnosis and prognosis
  - X-ray: “sentinel loop” (dilated proximal jejunum), calcification, and “colon cut-off sign” (colonic spasm)
  - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  - CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
- ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum

When thinking about the causes of acute pancreatitis remember: I GET SMASHED, but vast majority due to gallstones or ethanol.
Classification
- interstitial edematous vs. necrotizing
- mild, moderate, severe

Prognosis
- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to
  ■ shock
  ■ pulmonary edema
  ■ multi-organ dysfunction syndrome
  ■ GI ulceration due to stress
  ■ death
- numerous scales to describe severity; probably most useful is proportion of pancreas not taking up contrast on CT done 48 h after presentation (necrotic pancreas does not take up the contrast dye)
- presence of organ failure, particularly organ failure that persists > 48 h, is associated with worse outcomes

Table 21. Collections in pancreatitis (Revised 2012 Atlanta Classification)

<table>
<thead>
<tr>
<th>Liquid</th>
<th>Solid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acute</td>
<td>Acute peripancreatic fluid collection (APFC)</td>
</tr>
<tr>
<td>Chronic</td>
<td>Pancreatic pseudocyst</td>
</tr>
</tbody>
</table>

All of these collections are classified as infected or not infected

Treatment
- goals (only supportive therapy available)
  1. hemodynamic stability
  2. analgesia
  3. oxygen
  4. stop progression of damage (difficult)
  5. treat local and systemic complications
- antibiotics controversial except in documented infection (use cephalosporins, imipenem)
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
- beware third spacing of fluid, monitor urine output carefully
- NG suction (lets pancreas rest) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
- recent evidence supports nasogastric enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H₂-blockers, peritoneal lavage
- follow clinically and CT/ultrasound to exclude complications
- chief role of invasive intervention is to excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for > two weeks to allow demarcation between viable and necrotic tissue), better done endoscopically or radiologically than surgically if technically possible

Late Complications
- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
- drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
- infected necrosis/abscesses: antibiotics + percutaneous drainage, endoscopic vs. surgical
- bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: DM, pancreatic duct damage

Chronic Pancreatitis

Definition
- irreversible damage to pancreas characterized by
  1. pancreatic cell loss (from necrosis)
  2. inflammation
  3. fibrosis

Etiology/Pathophysiology
- alcohol (most common)
  ■ causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  ■ changes composition of pancreatic juice (e.g. increases viscosity)
• decreases pancreatic secretion of pancreatic stone protein (lithostathine) which normally solubilizes calcium salts
  ◆ precipitation of calcium within pancreatic duct results in duct and gland destruction
  • toxic effect on acinar and duct cells – directly or via increasing free radicals
  • acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
  • varying degrees of ductular dilatation, strictures, protein plugs, calcification
  • no satisfactory theory to explain why only a minority of alcoholics develop pancreatitis
  • unusual causes
    ◆ cystic fibrosis
    ◆ severe protein-calorie malnutrition
    ◆ hereditary
    ◆ idiopathic

**Signs and Symptoms**

• early stages
  • recurrent attacks of severe abdominal pain (upper abdomen and back)
  • chronic painless pancreatitis: 10%
• late stages: occurs in 15% of patients
  • malabsorption syndrome when >90% of function is lost, steatorrhea
  • diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

**Investigations**

• laboratory
  • increase in serum glucose
  • increase in serum ALP, less commonly bilirubin (jaundice)
  • serum amylase and lipase usually normal
  • stool elastase is low in steatorrhea
  • AXR: pancreatic calcifications
  • U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
  • MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
  • EUS: abnormalities of pancreatic parenchyma and pancreatic ducts, most sensitive test
  • 72 h fecal fat test: measures exocrine function
  • secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
  • fecal pancreatic enzyme measurement (elastase-1, chymotrypsin): available only in selected centres

**Treatment**

• most common problem is pain, difficult to control
  • general management
    ◆ total abstinence from alcohol
    ◆ enzyme replacement may help pain by resting pancreas via negative feedback
    ◆ analgesics
    ◆ celiac ganglion blocks
    ◆ time: pain decreases with time as pancreas "burns out"
  • endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct
  • surgery: drain pancreatic duct (pancreatecojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
  • steatorrhea
  • pancreatic enzyme replacement
  • restrict fat, increase carbohydrate and protein (may also decrease pain)
  • neither endoscopy nor surgery can improve pancreatic function

**Autoimmune Pancreatitis**

• most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

**Investigations**

• histology: lymphocyte and plasma cell infiltration of pancreas
• imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
• serology: increased serum IgG4
• other organ involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

**Treatment**

• responds to prednisone
Clinical Nutrition

Determination of Nutritional Status

- corrected weight loss (expressed as body mass index [kg/m²]) is most important parameter in assessing need for nutritional support
- Subjective Global Assessment: simple bedside tool to assess nutritional status, to help identify those who will benefit from nutritional support

Investigations
- plasma proteins: albumin, pre-albumin (shorter half life than albumin), transferrin
- decrease may indicate decreased nutritional status or disease state
- thyroid-binding globulin, retinol-binding protein (may be too sensitive)
- anthropometry (e.g. triceps skinfold thickness), grip strength less often used

Enteral Nutrition

Definition
- enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
- choice of tubes: nasogastric (NG), nasojejunal (NJ), percutaneous endoscopic gastrostomy (“G-tube” or “PEG tube”), percutaneous endoscopic jejunostomy (J-tube)
- tubes can also be placed endoscopically, radiologically or surgically

Indications
- oral feeding inadequate or contraindicated

Feeds
- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

Relative Contraindications
- non-functioning gut (e.g. intestinal obstruction, enteroenteral or enterocutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

Complications
- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein)
Parenteral Nutrition

Definition
- parenteral nutrition (PN) is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

Indications
- short-term (<1 mo)
  - whenever GI tract not functioning
  - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult to control sepsis
  - pre-operative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
  - renal failure: PN shown to increase rate of recovery; no increase in survival
  - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival
  - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)
  - some evidence for efficacy, but convincing data not available for
    - radiation/chemotherapy-induced enteritis
    - AIDS with wasting diarrhea
    - severe acute pancreatitis
- long-term (>1 mo): can be given at home
  - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
  - following surgical resection of >70% of small bowel (e.g. small bowel infarction)
  - severe motility diseases (e.g. scleroderma affecting bowel)

Relative Contraindications
- functional GI tract for enteral nutrition
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem
- unreliable patient or clinical setting

Complications of PN
- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: CHF, hyperglycemia, gallstones, cholestasis

Enteral Nutrition vs. Parenteral Nutrition
- fewer serious complications (especially sepsis)
- nutritional requirements for enterally administered nutrition better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- prevents gallstones by stimulating gallbladder motility
- much less expensive

Hypomagnesemia may be an initial sign of short bowel syndrome in patients who have undergone surgical bowel resection

Enteral vs. Parenteral Nutrition for Acute Pancreatitis
Cochrane DB of Syst Rev 2010;1:CD002837
Purpose: Compare EN vs TPN on mortality, morbidity, and hospital stay in patients with pancreatitis.
Study Selection: RCTs of TPN vs. EN in pancreatitis.
Results: Eight trials (n=348) were included. Enteral nutrition decreases RR of death (0.50), multiple organ failure (0.55), infection (0.39), and other local complications (0.70). It also decreased hospital stay by 2.37 d.
Conclusion: EN reduces mortality, organ failure, infections, and length of hospital stay in patients with pancreatitis.

</tr>
</tbody>
</table>

**Mechanism of Action:**
- **Antidiarrheal Agents:**
  - Acts as antidiarrheal viacholinergic, noncholingeric, opiate, and nonopiate receptor-mediated mechanisms; decreases activity of myenteric plexus
  - Inhibits GI propulsion via direct action on smooth muscle, resulting in a decrease in peristaltic action and increase in transit time

**Indications:**
- **Proton Pump Inhibitors:**
  - Adjunctive therapy for diarrhea, as above
  - Adjunctive therapy for acute non-specific diarrhea, chronic diarrhea associated with IBD and for reducing the volume of discharge for ileostomies, colostomies, and other intestinal resections

**Contraindications:**
- **Proton Pump Inhibitors:**
  - Hypersensitivity to drug
  - Same as above and UGIB
  - Same as above and H. pylori
  - Same as above and NSAID
  - Patients who require a low galactose diet

**Side Effects:**
- **Proton Pump Inhibitors:**
  - Dizziness, headache, flatulence, abdominal pain, nausea, rash increased risk of osteoporotic fracture (secondary to impaired calcium absorption)

Basic Anatomy Review

Figure 1. Abdominal incisions

Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)
1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
   • Camper’s fascia (fatty) → Dartos muscle/fascia
   • Scarpa’s fascia (membranous) → Colles’ superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
   • external oblique → inguinal ligament → external spermatic fascia and fascia lata
   • internal oblique → cremasteric muscle/fascia
   • transversus abdominis → posterior inguinal wall
4. transversalis fascia → internal spermatic fascia
5. preperitoneal fat
6. peritoneum → tunica vaginalis

Midline Abdominal Wall Layers (superficial to deep)
1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba (see Figure 3)
   • above arcuate line (midway between symphysis pubis and umbilicus)
     • anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
     • posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
   • below arcuate line
     • aponeuroses of external oblique, internal oblique, transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia
6. peritoneum
Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord

Differential Diagnoses of Common Presentations

Acute Abdominal Pain

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two main patterns constituting urgent general surgery referrals are peritonitis and obstruction

Table 1. Differential Diagnosis of Acute Abdominal Pain

In all patients presenting with an acute abdomen, order the following:

**KEY TESTS FOR SPECIFIC DIAGNOSIS**
- ALT, AST, bilirubin
- Lipase/amylase
- Urea/urea nitrogen
- HCG (in women of childbearing age)
- Troponin
- Lactate

**KEY TESTS FOR OR PREPARATION**
- CBC, electrolytes, creatinine, glucose
- INR/PTT
- CXR (if history of cardiac or pulmonary disease)
- ECG if clinically indicated by history or if >69 yr and no risk factors

**Types of Peritonitis**
- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

**Localization of Pain**
Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation; kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain

**Referred Pain**
- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (right paracolic gutter)
- Hip pain: to groin
### Differential Diagnoses of Common Presentations

#### Most Common Presentations of Surgical Pain
- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = ischemic bowel
- Vague pain that subsequently localizes = appendixitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction

#### Table 1. Differential Diagnosis of Acute Abdominal Pain (continued)

</tbody>
</table>

#### Right Lower Quadrant (RLQ)

| Intestine: stool, tumour (CRC, mesenteric adenitis, appendicitis, appendiceal phelegm or other abscess, typhilitis, intussusception, Crohn’s inflammation | Uterus: pregnancy, leiomyoma (fibroid), uterine cancer, pyometra, hematometra | Intestine: stool, tumour, abscess (see RLQ) |
| Ovary: ectopic pregnancy, cyst (physiological vs. pathological), tumour (serous, mucinous, x ruma ovari, germ cell, Knuekenberg) | GU: bladder distention, tumour | Ovary: see RLQ |
| Fallopian tube: ectopic pregnancy, tubo-ovarian abscess, hydrosalpinx, tumour | | Fallopian tube: see RLQ |

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate surgical intervention.
Gastrointestinal Bleeding

- see Gastroenterology, G25

Indications for Surgery
Failure of medical management
- Exsanguinating hemorrhage: hemodynamic instability despite vigorous resuscitation
- Recurrent hemorrhage with up to two attempts of endoscopic hemostasis
- Prolonged bleeding with transfusion requirement >3 units
- Bleeding at rate >1 unit/8 h

Surgical Management of GI Bleeding
- UGIB
  - Bleeding from a source proximal to the ligament of Treitz
  - Often presents with hematemesis and melena unless very brisk (then can present with hematochezia)
  - Initial management with endoscopy; if fails, then consider surgical management appropriate to etiology
  - PUD accounts for approximately 55% of severe UGIB
- LGIB
  - Bleeding from a source distal to the ligament of Treitz
  - Often presents with BRB unless proximal to transverse colon
  - May occasionally present with melena
  - Initial management with colonoscopy to detect and potentially stop source of bleeding
  - 75% of patients will spontaneously stop bleeding, however if bleeding continues barium enema should NOT be performed
  - Angiography or RBC scan to determine source as indicated
  - Surgery indicated if bleeding is persistent - aimed at resection of area containing source of bleeding
  - Obscure bleed may require blind total colectomy if the source is not found

</tr>
</tbody>
</table>

*Managed surgically in most cases

Jaundice

- see Gastroenterology, G40

Indications for Urgent Operation

IHOP
- Ischemia
- Hemorrhage
- Obstruction
- Perforation

Overt bleeding: obvious hematemesis, hematochezia or melena per rectum (i.e. visible to naked eye)

Occult bleeding: bleeding per rectum is not obvious to naked eye (e.g. positive guaiac FOBT)

Obscure bleeding: bleeding with no identifiable source after colonoscopy and endoscopy (source usually in small bowel). Can be either overt or occult

Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

Recent study by Villanueva et al., demonstrates that a restrictive transfusion strategy (transfusion with hemoglobin below 70 g/L) significantly improves outcomes in patients with acute UGIB compared to a liberal transfusion strategy (transfusion with hemoglobin below 90 g/L). Refer to study for details.

Biochemical Signs for Differentiating Jaundice

Hepatocellular: Elevated bilirubin + elevated ALT/AST

Cholestatic: Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary US

Hemolysis: ↑ haptoglobin ↑ LDH

Note: cholestatic jaundice is often surgical
Pre-Operative Preparations

Considerations
- informed consent (see Ethical, Legal, and Organizational Medicine, ELOM7)
- screening questionnaire to determine risk factors e.g. age, exercise capacity, medication use, allergies
- consider pre-operative anesthesia, medicine consult as indicated to optimize patient status
- NPO according to guidelines (see Anesthesia and Perioperative Medicine, A4)
- IV – balanced crystalloid at maintenance rate (4:2:1 rule → roughly 100-125 cc/h): normal saline or Ringer’s lactate; bolus to catch up on estimated losses including losses from bowel prep
  - appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- patient’s regular medications included with the exception of hypoglycemic agents, diuretics and ACEI
- patients on steroids may require stress dose coverage, anticoagulation/antiplatelet medication must be managed to decrease surgical bleeding but not put patient at risk for increased thrombotic events (e.g. switching from warfarin to LMWH)
- prophylactic antibiotics depending on wound class (within 1 h prior to incision): usually cefazolin (Ancef®) ± metronidazole (Flagyl®)
  - consider MBP: cleans out bowel
    - oral cathartic (e.g. Fleet Phosphosoda®) starting previous day
    - in selected cases, current evidence does not support routine use
  - consider VTE prophylaxis for all inpatient surgery (LMWH or heparin)
  - do not hold anticoagulation prior to surgery unless epidural is expected
  - smoking cessation and weight loss pre-operative can significantly decrease post-operative complications
  - infection: delay elective surgery until infection controlled, including respiratory infection (particularly in asthma patients)

Investigations
- see Anesthesia and Perioperative Medicine, A4
- routine pre-operative laboratory investigations for elective procedures should be selective
  - only ASA class and surgical risk have been found to independently predict post-operative adverse effects
  - blood components: group and screen or cross and type depending on procedure
  - CBC, electrolytes, creatinine
  - INR/PT, PTT
  - CXR (PA and lateral) for patients with history of cardiac or pulmonary disease
  - ECG as indicated by history or if >69 yr and no risk factors
  - β-hCG testing in all women of reproductive age

Drains
- NGT
  - indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, feeding, if necessary
  - contraindications: suspected basal skull fracture, obstruction of nasal passages, esophageal strictures, esophageal varices
- Foley catheter with urometer
  - indications: to accurately monitor urinary output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
  - contraindications: suspected urethral injury, and difficult insertion of catheter

Surgical Complications
- general principles in preventing complications during the post-operative period include
  - frequent examination of the patient (daily or more) and their wound
  - removal of surgical tubes as soon as possible (e.g. Foley catheters and surgical drains)
  - early ambulation
  - monitor fluid balance and electrolytes
  - analgesia - enough to adequately address pain, but not excessive
  - skillful nursing care

Post-Operative Fever
- fever does not necessarily imply infection particularly in the first 24-48 h post-operative
- fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids, or immunosuppression
- timing of fever may help identify cause
  - hours after surgery – POD #1 (immediate)
    - inflammatory reaction in response to trauma from surgery; unlikely to be infectious
    - reaction to blood products received during surgery
    - malignant hyperthermia

Billirubin Levels

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out

Surgical Emergencies: Take an AMPLE History
- Allergies
- Medications
- Past medical/surgical history (including anesthesia and bleeding disorders)
- Last meal
- Events (HPI)

Best Practice in General Surgery (BPIGS)
http://www.bpgs.ca/
BPIGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains EBM based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up-to-date pre-operative and general treatment guidelines

Mechanical Bowel Preparation Strategies: A Clinical Practice Guideline developed by the University of Toronto’s Best Practice in Surgery
1. All open/laparoscopic colorectal procedures (excluding LARs ± diverting stoma)
   - No MBP
   - No dietary restrictions before NPO
   - Fleet enema for left colon
   - Anastomoses with transrectal stapling
2. Open/laparoscopic LAR ± diverting stoma
   - MBP
   - No dietary restrictions before MBP, clear fluids after MBP complete

Drain Size
- Measured by the unit French:
  - French = diameter (mm) x 3

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out
Surgical Complications

- POD #1-2 (acute)
  - atelectasis (most common cause of fever on POD #1)
  - early wound infection (especially Clostridium, Group A Streptococcus – feel for crepitus and ooze for “dishwasher” drainage)
  - aspiration pneumonitis
  - other: Addisonian crisis, thyroid storm, and transfusion reaction
- POD #3-7 (subacute): likely infectious
  - UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, and leakage at bowel anastomosis (tachycardia, hypotension, oliguria, and abdominal pain)
- POD #8+ (delayed)
  - intra-abdominal abscess, DVT/PE (can be anytime post-operative, most commonly POD #8-10), and drug fever
  - other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, C. difficile colitis, and endocarditis

Treatment
- treat primary cause
- antipyrexia (e.g. acetaminophen)

Wound/Incisional Complications

WOUND CARE (see Plastic Surgery, PL8)
- can shower POD #2-3 after epithelialization of wound
dressings can be removed POD #2 and left uncovered if dry
- examine wound if wet dressing, signs of infection (fever, tachycardia, and pain)
skin sutures and staples can be removed POD #7-10
- exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, or immunosuppressed) removed POD #14, earlier if signs of infection
- negative pressure dressings consist of foam and suction, promote granulation
  - ideal for large (grafted sites) or non-healing wounds (irradiated skin, or ulcer)

DRAINS
- drains may be placed selectively at the time of surgery to prevent fluid accumulation (blood, pus, serum, bile, and urine)
- can be used to assess quantity of third space fluid accumulation post-operatively
- potential route of infection; to decrease risk of wound infection bring out through separate incision (vs operative wound) and remove as soon as possible
- types of drains
  - open (e.g. Penrose), higher risk of infection
  - closed: 1) Gravity drainage (e.g. Foley catheter); 2) Underwater-seal drainage system (e.g. chest tube); 3) Suction drainage (e.g. Jackson-Pratt)
  - sump (e.g. NGT)
- monitor drain outputs daily
- drains should be removed once drainage is minimal (usually <30-50 cc/24 h)
- drains do not guarantee that the patient will not form a collection of fluid
- ridged drains can erode through internal structures, and excessive suction can cause necrosis
- evidence does not support routine post-operative drainage of abdominal cavity

SURGICAL SITE INFECTION

Etiology
- *S. aureus*, *E. coli*, *Enterococcus*, *Streptococcus* spp., *Clostridium* spp.

Risk Factors

Surgical Complications

- patient characteristics
  - age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, and chemotherapy
- other factors
  - prolonged pre-operative hospitalization, reduced blood flow, break in sterile technique, multiple antibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, and hyperthermia

Prophylaxis
- pre-operative antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamycin)
- within 1 h pre-incision; can redose at 1-2 half-lives (~q4-8h) in the OR
- not required for low risk elective cholecystectomy, hemorrhoidectomy, fistulotomy, and sphincterotomy for fissure
- some evidence suggests role in breast surgery
- reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection
- normothermia (maintain patient temperature 36-38°C during OR)
- hyperoxygenation (consider FiO₂ of 80% in OR)
- chlorhexidine alcohol wash of surgical site
- hair removal should not be performed unless necessary; if so, clipping superior to shaving
- consider delayed primary closure of incision for contaminated wounds

Clinical Presentation
- typically fever POD #5-8 (Streptococcus and Clostridium can present in 24 h)
- pain, blanchable wound erythema, induration, purulent discharge, and warmth
- complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, and hernia

Treatment
- examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
- re-open affected part of incision, drain, pack, heal by secondary intention in most cases
- for deeper infections, debride necrotic and non-ammable tissue
- antibiotics and dermal healing of erythema only if cellulitis or immunodeficiency

WOUND HEMORRHAGE/HEMATOMA
- secondary to inadequate surgical control of hemostasis

Risk Factors
- anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial HTN, and severe cough
- more common with transverse incisions through muscle, due to cutting of muscle

Clinical Features
- pain, swelling, discoloration of wound edges, and leakage
- rapidly expanding neck hematoma can compromise airway and is a surgical emergency: consider having a suture kit at bedside in all neck surgery in the event of having to open the wound emergently

Treatment
- pressure dressing
- open drainage ± wound packing (large hematoma only)
- if significant bleeding, may need to re-operate to find source (often do not find a discrete source)

SEROMA
- fluid collection other than pus or blood
- secondary to transection of lymph vessels
- delays healing
- increased infection risk

Treatment
- consider pressure dressing ± needle drainage
- if significant may need to re-operate

WOUND DEHISCENCE
- disruption of fascial layer, abdominal contents contained by skin only
- 95% caused by intact suture tearing through fascia

Risk Factors
- local: technical failure of closure, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing, and transverse incision

Systemic Prophylactic Antibiotics

Pre-Operative Skin Antiseptics for Preventing Surgical Wound Infections After Clean Surgery

- Cochrane DB Syst Rev 2015;6:CD003949
- Purpose: To determine if pre-operative skin antiseptics prior to clean surgery prevents surgical-site infection (SSI) and compare the effectiveness of other antiseptics.
- Methods: Systematic review of randomized-controlled trials (RCTs) of the Cochrane Wounds Group Specialised Register and the Cochrane Central Register of Controlled Trials (CENTRAL).
- Main outcome was SSI. Secondary outcomes included quality of life, mortality, and resource use.
- Results: 13 RCTs (n=2,623 patients) were included that made 11 total comparisons between skin antiseptics. A single study found that 0.5% chlorhexidine solution in methylated spirits was significantly superior in preventing SSIs after clean surgery compared to alcohol based povidone iodine solution. No other statistically significant differences were found.
- Conclusions: Further research is warranted to determine the effectiveness of one antiseptic over the others at preventing SSI post clean surgery.

Systemic Review and Meta-Analysis of Randomized Clinical Trials Comparing Primary vs. Delayed Primary Skin Closure in Contaminated and Dirty Abdominal Incisions

- Purpose: To compare rates of surgical site infection (SSI) with delayed primary closure (DPC) vs. primary skin closure (PC).
- Results/Conclusions: 8 RCTs with 623 patients. Most common diagnosis was appendicitis (77.4%). Although there was significant heterogeneity between studies, DPC (2-5 d time to first review) was found to significantly reduce the chance of SSI (OR 0.65, 95% CI 0.40-0.90). Although current trials are poorly designed, DPC may be a simple and cost-effective way of reducing the rates of SSIs following abdominal surgery with contaminated or dirty wounds.

Pre-Operative Antibiotics

Updated Recommendations for Control of Surgical Site Infections
- Ann Surg 2011;253:1082-93
- Choice of routine prophylactic antibiotic depends on the pathogen and patient allergies.
- Vancomycin and fluoroquinolones should be administered 1-2 h prior to incision; all other antibiotics should be administered 30 min prior to incision.
- Short-acting antibiotics should be redosed —3 h after incision.
- Antibiotic administration >24 h after surgery does not appear to add benefits.
- Antibiotics should no longer be routinely administered in three doses.
- The majority of antibiotics are renally excreted hence renal function must be considered in antibiotic administration.
- Obese patients need higher antibiotic doses to achieve therapeutic concentrations.
- Drug half-life and length of operation need to be considered in antibiotic administration.
Surgical Complications

- systemic: male, smoking, malnutrition (hypalbuminemia, vitamin C deficiency), connective tissue
diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy,
obesity, and other (e.g. age, sepsis, and uremia)
- DM alone is not a risk factor

Clinical Features
- typically POD #1-3; most common presentation sign is serosanguinous drainage from wound
- ± evisceration
- palpation of wound edge: should normally feel a "healing ridge" from abdominal wall closure (raised
area of tissue under incision)

Treatment
- place moist dressing over wound with binder around abdomen and transfer to OR
- may consider conservative management with debridement of fascial and/or skin margins
- evisceration (also known as 'burst abdomen') is a surgical emergency: take patient for operative re-
closure without abdomen binder

Urinary and Renal Complications

Urinary Retention
- may occur after any operation with general anesthesia or more commonly spinal anesthesia
- more likely in older males with history of benign prostatic hyperplasia, and patients on anticholinergics

Clinical Presentation
- abdominal discomfort, palpable bladderoverflow incontinence, post-void residual urine volume >100 mL

Treatment
- Foley catheter to rest bladder, then trial of voiding

Oliguria/Anuria (see Nephrology, NP18)

Etiology
- prerenal vs. renal vs. postrenal
- most common post-operative cause is prerenal ± ischemic ATN
  - external fluid loss: hemorrhage, dehydration, and diarrhea
  - internal fluid loss: third-spacing due to bowel obstruction, and pancreatitis

Clinical Presentation
- urine output <0.5 cc/kg/h, increasing Cr, and increasing BUN

Treatment
- according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

Post-Operative Dyspnea

- see Respiratory Complications next and Cardiac Complications, GS12

Etiology
- respiratory: atelectasis, pneumonia/pneumonitis, pulmonary embolus (PE), ARDS, asthma, and pleural
  effusion
- cardiac: MI arrhythmia, and CHF
- inadequate pain control

Respiratory Complications

Atelectasis
- comprises 90% of post-operative pulmonary complications

Risk Factors
- COPD, smoking, obesity, and elderly persons
- upper abdominal/thoracic surgery, oversedation, significant post-operative pain, and poor inspiratory
  effort

Clinical Features
- low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, and
tachypnea
Treatment
- pre-operative prophylaxis
  - smoking cessation (best if >8 wk pre-operative)
- post-operative prophylaxis
  - incentive spirometry, deep breathing exercise, chest physiotherapy, and intermittent positive-pressure breathing
  - selective NGT decompression after abdominal surgery
  - short-acting neuromuscular blocking agents
  - minimize use of respiratory depressant drugs, appropriate pain control, and early ambulation

PNEUMONIA/PNEUMONITIS
- may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

Risk Factors
- aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NGT, pregnancy, and seizure disorder
- non-aspiration: atelectasis, immobility, and pre-existing respiratory disease

Clinical Features
- productive cough, and fever
- tachycardia, cyanosis, respiratory failure, and decreased LOC
- CXR: pulmonary infiltrate

Treatment
- prophylaxis: see atelectasis prophylaxis, pre-operative NPO/NGT, and rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- empiric IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. piperacillin-tazobactam, cefepimemetronidazole)

PULMONARY EMBOLUS (see Respirology, R18)

Clinical Features
- unilateral leg swelling and pain (DVT as a source of PE), sudden onset dyspnea, pleuritic chest pain, tachycardia, and fever
- most commonly POD #8-10, but can occur anytime post-operatively, even after discharge
- diagnosis made by Chest CT scan usually

Treatment
- initial treatment: IV heparin or subcutaneous LMWH, bridging to therapeutic anticoagulation is required for a minimum of 3 mo; for patients with cancer, or other risk factors for hypercoagulability, the duration of anticoagulation may be longer
- Greenfield (IVC) filter if contraindications to anticoagulation
- prophylaxis: subcutaneous heparin (5,000 U bid) or LMWH, compression stockings (TED™ Hose), and sequential compression devices

PULMONARY EDEMA

Etiology
- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, and alveolar injury due to toxins (e.g. ARDS)
  - more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anesthesia

Clinical Features
- shortness of breath, crackles at lung bases, and CXR abnormal

Treatment (LMNOP)
- Lasix
- Morphine (decreases symptoms of dyspnea, venodilator, and afterload reduction)
- Nitrates (venodilator)
- Oxygen + non-invasive ventilation
- Position (sit patient up)
**RESPIRATORY FAILURE**

**Clinical Features**
- dyspnea, cyanosis, and evidence of obstructive lung disease
- earliest manifestations - tachypnea and hypoxemia (RR >25, pO2 <60)
- pulmonary edema, and unexplained decrease in SaO2

**Treatment**
- ABCs, O2, ± positive pressure ventilation, and intubation
- bronchodilators, and diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep PaO2 >60, consider ARDS (see Respilology, R27)

**Cardiac Complications**
- abnormal ECGs common in post-operative period (compare to pre-operative ECG)
- common arrhythmias: supraventricular tachycardia, atrial fibrillation (secondary to fluid overload, PE, and MI)

**MYOCARDIAL INFARCTION**
- see Cardiology and Cardiac Surgery, C27
- surgery increases risk of MI
- incidence
  - 0.5% in previously asymptomatic men >50 yr old
  - 40-fold increase in men >50 yr old with previous MI

**Risk Factors**
- pre-operative HTN, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intra-operative hypotension
- operations >3 h
- angina

**Clinical Features**
- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, and hypotension

**Intra-Abdominal Abscess**

**Definition**
- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

**Etiology**
- usually polymicrobial: Gram-negative bacteria, and anaerobes
  - consider Gram-positives if coexisting cellulitis

**Risk Factors**
- emergency surgery, and contaminated OR
- GI surgery with anastomoses
- poor healing risk factors (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

**Clinical Features**
- persistent spiking fever, dull pain, and weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, and elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison's pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, and psoas

**Investigations**
- CBC, blood cultures x2
- CT ± IV and water-soluble contrast
- DRE (pelvic abscess)
**Treatment**
- drain placement by interventional radiology (preferred), laparoscopy, and open drainage
- subsequent antibiotic coverage; ceftriaxone + metronidazole or piperacillin-tazobactam (Pip-Tazo)

**Paralytic Ileus**
- see Bowel Obstruction, GS23

**Delirium**
- see Psychiatry, PS19 and Neurology, N20

---

**Thoracic Surgery**

**Hiatus Hernia**

![Image of hiatus hernia types](image)

**Figure 6. Types of hiatus hernia**

**SLIDING HIATUS HERNIA (TYPE I)**
- see Figure 6
- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

**Risk Factors**
- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, and heavy lifting)
- smoking

**Clinical Features**
- majority are asymptomatic
- hernias frequently associated with GERD due to decreased competence of LES

**Complications**
- most common complication is GERD
- other complications are rare and are related to reflux
- esophagitis (dysphagia, and heartburn)
- consequences of esophagitis (peptic stricture, Barrett's esophagus, and esophageal carcinoma)
- extra-esophageal complications (aspiration pneumonitis/pneumonia, asthma type bronchospasm, cough, and laryngitis)

**Investigations**
- barium swallow, endoscopy (esophago-gastroscopy), or esophageal manometry (technique for measuring LES pressure)
- 24 h esophageal pH monitoring to quantify reflux
- endoscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett's esophagus, and cancer

© Jerusha Ellis 2012
Treatment
• lifestyle modification
  ■ stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint, and fat
  ■ medical
    ▲ antacid, H2-antagonist, PPI, prokinetic agent
  ■ surgical (<15%)
    ● if failure of medical therapy, complications of GERD such as esophageal stricture, severe nocturnal aspiration, Barrett’s esophagus
    ■ anti-reflux procedure (usually laparoscopic) e.g. Nissen fundoplication
      ● fundus of stomach is wrapped around the lower esophagus and sutured in place
      ● 90% success rate

Paraesophageal Hiatus Hernia (Type II)
• see Figure 6
  ● herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
  ● least common esophageal hernia (<10%)

Clinical Features
• usually asymptomatic due to normal GE junction
• pressure sensation in lower chest, dysphagia

Complications
• hemorrhage, incarceration, strangulation (gastric volvulus), obstruction, gastric stasis ulcer (Cameron’s lesion – causes Fe-deficiency anemia)

Treatment
• surgery to address symptoms or treat/prevent complications
• reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
• may consider suturing stomach to anterior abdominal wall (gastroscopy)
• in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy) to anchor the stomach in the abdomen

Mixed Hiatus Hernia (Type III)
• see Figure 6
• combination of Types I and II

Type IV Hernia
• herniation of stomach and other abdominal organs into thorax: colon, spleen, small bowel
• Fe-deficiency anemia is common

Esophageal Perforation

Etiology
• iatrogenic (most common)
  ■ endoscopic, dilatation, biopsy, intubation, operative, and NGT placement (rare)
  ■ barogenic
  ■ trauma
  ■ repeated forceful vomiting (Boerhaave’s syndrome)
  ■ other: convulsions, defecation, or labour (rare)
  ■ ingestion injury
  ■ foreign body, or corrosive substance
  ■ carcinoma

Clinical Features
• neck or chest pain
• fever, tachycardia, hypotension, dyspnea, and respiratory compromise
• subcutaneous emphysema, pneumothorax, pleural effusion, and hematemesis

Investigations
• CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air, and widened mediastinum
• CT chest: pneumomediastinum, pleural effusion, pneumothorax, contrast in the chest, and subcutaneous emphysema
• upper GI swallow study with water soluble contrast
  ● if negative then perform with diluted barium: contrast extravasation

Boerhaave’s syndrome: transmural esophageal perforation
Mallory-Weiss tear: non-transmural esophageal tear (partial thickness tear)
Both are associated with forceful emesis
6Ss of SCC
$ Smoking
$ Spirits (alcohol)
$ Seeds (betel nut)
$ Scalding (hot liquid)
$ Strictures
$ Sack (diverticula)
Treatment
- support if rupture is contained
  - NPO, fluid resuscitation, broad-spectrum antibiotics, and possible percutaneous drainage of mediastinum or pleura
- surgical
  - <24 h from perforation
    - primary closure of a healthy esophagus or resection of diseased esophagus
  - >24 h from perforation or non-viable wound edges
    - diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, and gastrostomy/jejunostomy for decompression/feeding)

Complications
- sepsis, abscess, fistula, empyema, mediastinitis, and death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis

Esophageal Carcinoma

Epidemiology
- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), and lower (33-50%)
- main types
  - most common worldwide: SCC in upper 2/3 of esophagus
  - most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

Risk Factors
- SCC
  - underlying esophageal disease such as strictures, diverticula, and achalasia
  - smoking, alcohol, hot liquids
  - more common in black and Asian populations
- adenocarcinoma
  - Barrett's esophagus (most important), smoking, obesity (increased reflux), and GERD
  - more common in Caucasian populations

Clinical Features
- progressive dysphagia (mechanical): first solids then liquids
- odynophagia then constant pain
- constitutional symptoms
- regurgitation and aspiration (aspiration pneumonia)
- hematemesis, and anemia
- direct, hematogenous, or lymphatic spread
- trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac and mediastinal nodes

Investigations and Staging
- barium swallow: shows narrowing - suggestive but not diagnostic
- endoscopic biopsy and assess resectability
- both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
- endoscopic U/S (EUS)
  - visualize local disease
  - regional nodal involvement (number of nodes may be more important than location)
- bronchoscopy ± thoracotomy
  - rule out airway invasion in tumours of the upper and mid esophagus
- full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, and LFTs, etc.)
- PET scan more sensitive than CT in detecting metastatic disease

Treatment
- if present with distant metastatic disease
- treat with systemic therapy and treat symptoms (esophageal stent)
  - if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  - multimodal therapy
    - concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    - possibility of curative esophagectomy after chemoradiation if disease responds well
  - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stent/laser ablation for palliation
  - if present with distant metastatic disease
   - palliative if rupture is contained
   - supportive if rupture is contained
   - >24 h from perforation
     - primary closure of a healthy esophagus or resection of diseased esophagus
   - <24 h from perforation or non-viable wound edges
     - diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, and gastrostomy/jejunostomy for decompression/feeding)

Complications
- sepsis, abscess, fistula, empyema, mediastinitis, and death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis

Esophageal Carcinoma

Epidemiology
- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), and lower (33-50%)
- main types
  - most common worldwide: SCC in upper 2/3 of esophagus
  - most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

Risk Factors

Investigations and Staging
- barium swallow: shows narrowing – suggestive but not diagnostic
- endoscopic biopsy and assess resectability
- both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
- endoscopic U/S (EUS)
  - visualize local disease
  - regional nodal involvement (number of nodes may be more important than location)
- bronchoscopy ± thoracotomy
  - rule out airway invasion in tumours of the upper and mid esophagus
- full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, and LFTs, etc.)
- PET scan more sensitive than CT in detecting metastatic disease

Treatment
- if present with distant metastatic disease
- treat with systemic therapy and treat symptoms (esophageal stent)
  - if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  - multimodal therapy
    - concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    - possibility of curative esophagectomy after chemoradiation if disease responds well
  - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stent/laser ablation for palliation

Complications
- sepsis, abscess, fistula, empyema, mediastinitis, and death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis
• if early stage (non-transmural and without evidence of nodal disease)
  • endoscopic mucosal resection can be considered for early mucosal cancer or high grade dysplasia
  • esophagectomy (transhiatal or trans-thoracic approach) and lymphadenectomy
  • anastomosis in chest or neck
  • stomach most often used for reconstruction; may also use colon
  • neoadjuvant chemotherapy and radiation are controversial
  • adjuvant chemotherapy ± radiation usually recommended for post-operative node-positive disease

Prognosis
• TNM status - usually poor because presentation is usually at advanced stage.

OTHER DISORDERS
• esophageal motor disorders (see Gastroenterology, G8)
• esophageal varices (see Gastroenterology, G26)
• Mallory-Weiss tear (see Gastroenterology, G26)

Thymoma

Epidemiology
• rare neoplasms in thymus including both thymoma and thymic carcinoma
• patients between 40 and 60 yr
• M = F

Risk Factors
• no known risk factors, strong association with myasthenia gravis and other paraneoplastic syndromes

Clinical Presentation
• frequently asymptomatic: incidental finding on imaging
• symptoms related to tumour size and location or myasthenia gravis: chest pain, SOB, cough, and phrenic nerve palsy
• ddx includes lymphoma, other anterior mediastinal tumours (see Respirology, R21)

Investigations
• CT chest (and/or MRI)
• Germ cell tumour markers (β-hCG, alpha fetoprotein), thyroid function, and PFTs

Treatment
• for patients with resectable disease
  • surgical resection of thymus via median sternotomy or VATS depending on the size
  • ± post-operative radiation based on Masaoka staging
• for non-surgical patients
  • multimodal therapy including neoadjuvant or palliative chemotherapy and post-operative chemoradiotherapy if de-bulking procedure feasible

Prognosis
• depends upon stage of disease and resectability
• generally slow growing tumours and have good prognosis, however thymic carcinomas more aggressive and have poorer prognosis

Pleura, Lung, and Mediastinum
• see Respirology, R22

Tube Thoracostomy

Indications
• to drain abnormal large-volume air or fluid collections in the pleural space
  • hemothorax, pleural effusion, chylothorax, and empyema
  • pneumothorax, if:
    • large or progressive
    • patient is on mechanical ventilation
    • bronchopleural fistula
    • tension pneumothorax
  • to treat symptomatic and/or recurrent pleural effusion
  • see Respirology, R22
  • for long-term drainage of malignant effusions use: 1. Tunneled pleural catheter; 2. Pleural drainage and chemical pleurodesis
  • via facilitation of pleurodesis (obliteration of the pleural space by instilling talc or doxycycline to cause fibrosis and adherence of parietal and visceral pleura)
Complications
- overall complications are rare (1-3%)
  - malposition (most common complication), especially by inexperienced operators
    - tubes may dissect along the external chest wall, or may be placed below the diaphragm
  - bleeding (anticoagulation is a relative contraindication)
  - local infection, empyema
  - perforation of lung parenchyma or vasculature
  - risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)

Lung Transplantation

Conditions Leading to Transplantation
- chronic acquired lung disease: COPD
- genetic: CF, and emphysema due to α-1 antitrypsin deficiency
- idiopathic interstitial pneumonias: IPF, and nonspecific interstitial pneumonitis
- HTN-related: IPAH, secondary pulmonary HTN, and Eisenmenger's syndrome
- other: sarcoidosis, lymphangioleiomyomatosis, and pulmonary Langerhans cell histiocytosis

Clinical Indications
- transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
- patients who are symptomatic during activities of daily living and have risk of death >50% over the next 2 yr

Criteria for Transplantation
- lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
  - transplant benefit = post-transplant survival (days) – waitlist survival (days)

Contraindications
- uncontrolled or untreatable pulmonary, or extrapulmonary infection
- malignancy in the last 2 yr
- advanced cardiopulmonary disease
- significant chest wall/spinal deformity
- active cigarette smoking, and BMI ≥ 35
- HIV infection, ongoing HBV, HCV, or TB infections

Post-Operative Complications
- primary graft dysfunction: main cause is ischemia reperfusion injury, graded by PaO2/FiO2 ratio and CXR findings
- airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, and fistula)
- chronic graft dysfunction: bronchiolitis obliterans syndrome, and restrictive allograft syndrome
- infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, and mycobacteria)
- malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi's sarcoma, and bladder)

Prognosis
- median survival for all adult recipients: 5.7 yr
- 1 yr survival: COPD > IPF > IPAH
- 10 yr survival: CF, α-1 antitrypsin deficiency > IPAH > COPD > IPF

Chronic Obstructive Pulmonary Disease
- see Respirology, R9

Treatment
- indications for surgical management
  - dyspnea despite maximal medical therapy and pulmonary rehabilitation
  - CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
  - may be used as a bridging procedure to lung transplantation
- contraindications
  - age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
  - homogeneously distributed emphysematous changes without areas of preserved lung tissue
  - diffusing capacity of lung for carbon monoxide <20% of predicted, PaCO2: >60 mmHg, PaO2: <45 mmHg
- surgical procedures
  - lung volume reduction surgery: wedge excision of emphysematous tissue
  - bilateral or unilateral, thoracotomy or VATS

---

Long-Term Survival Analysis of the Canadian Lung Volume Reduction Surgery Trial

Study: Retrospective observational study assessing the long-term survival of patients enrolled in the CLVRS at 8-10 yr follow-up.

Results/Conclusions: Compared with the best medical care group, patients in the LVRS group showed a 16-mo survival advantage and a 20% reduction in mortality. Although not statistically significant, LVRS may provide long-term benefits in the treatment of end-stage emphysema.
Complications of Treatment
- air leak; may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

Prognosis
- total mortality at 2 yr same as with maximal medical therapy, but better exercise capacity and quality of life with LVRS

Stomach and Duodenum

Peptic Ulcer Disease

GASTRIC ULCERS
- see Gastroenterology, G11

Indications for Surgery
- refractory to medical management
- suspicion of malignancy (even if biopsy benign)
- complications of PUD: obstruction, perforation, and bleeding (3x greater risk compared to duodenal ulcers)
- surgical treatment is increasingly rare due to H. pylori eradication and medical treatment

Procedures
- ligation of bleeding vessels
- distal gastrectomy with ulcer excision: Billroth II, Roux-en-Y gastrojejunostomy or Billroth I (rarely) reconstruction
- vagotomy and pyloroplasty only if acid hypersecretion (rare)
- wedge resection if possible or biopsy with primary repair

DUODENAL ULCERS
- see Gastroenterology, Bleeding Peptic Ulcer, G12, and Peptic Ulcer Disease, G11
- most within 2 cm of pylorus (duodenal bulb)

Indications for Surgery
- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
- refractory to medical and endoscopic management

Procedures
- omental (Graham) patch: plication of ulcer supported by overlying omental patch
- oversewing of bleeding ulcer ± pyloroplasty
- treat with H pylori eradication protocol post operatively

Complications of Gastric Surgery
- retained antrum
- fistula (gastrocolic/gastrojejunual)
- dumping syndrome, postvagotomy diarrhea, afferent loop syndrome (see Complications of Gastric Surgery, GS21)

Table 5. Complications of Duodenal Ulceration

<table>
<thead>
<tr>
<th>Complication</th>
<th>Clinical Features</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perforated Ulcer (typically on anterior surface)</td>
<td>Sudden onset of pain (possibly in RLQ due to track down right paracolic gutter) Acute abdomen: rigid, diffuse guarding Heus Initial chemical peritonitis followed by bacterial peritonitis</td>
<td>In-estigation CXR - free air under diaphragm (70% of patients) Treatment Oversew ulcer (plication) and omental (Graham) patch – most common treatment</td>
</tr>
<tr>
<td>Posterior Penetration</td>
<td>Elevated amylase/lipase if penetration into pancreas Constant mid-epigastric pain burrowing into back, unrelated to meals</td>
<td>Resuscitation initially with crystalloids; blood transfusion if necessary Diagnostic and/or therapeutic endoscopy (laser, cautery, or injection); if recurs, may have second scope Consider interventional radiology: angiography with embolization/ coiling Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and I&amp;d: oversewing of ulcer, pyloroplasty</td>
</tr>
<tr>
<td>Hemorrhage (typically on posterior surface)</td>
<td>Gastroduodenal artery involvement</td>
<td>NGT decompression and correction of hypochloremic, hypokalemic metabolic alkalosis Medical management initially: high dose PPI therapy Surgical resection if obstruction does not resolve: either Billroth I, pyloroplasty, or gastrojejunostomy</td>
</tr>
<tr>
<td>Gastric Outlet Obstruction</td>
<td>Ucer can lead to edema, fibrosis of pyloric channel, and neoplasia N/V (undigested food, non-bilious), dilated stomach, and crampy abdominal pain Succussion splash (splashing noise heard with stethoscope over the stomach when patient is shaken) Auscultate gas and fluid movement in obstructed organ</td>
<td>Figure 9. Billroth I and Billroth II with Roux-en-Y reconstruction (gastrojejunostomy)</td>

</tbody>
</table>

Kissing Ulcer: combination of perforation and bleeding
Gastric Carcinoma

Epidemiology
- 5th most common cancer in the world
- M:F = 3:2
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr
- incidence of adenocarcinoma <10 (US) vs. 40 (Japan, Korea) per 100,000 (incidence highest in Asia, Latin America, and Caribbean)

Risk Factors
- compensatory epithelial cell proliferation via gastric atrophy from:
  - *H. pylori*, causing chronic atrophic gastritis
  - pernicious anemia associated with achlorhydria and chronic atrophic gastritis
  - previous partial gastrectomy (>10 yr post-gastrectomy)
- host-related factors
  - blood type A
  - hereditary nonpolyposis colorectal cancer (HNPCC), hereditary diffuse gastric carcinoma (HDGC)
  - gastric adenomatous polyps
  - hypertrophic gastropathy
  - genetic syndromes: hereditary diffuse gastric cancer E-cadherin (CDH-1) gene
- environmental factors: smoking, alcohol, smoked food, and nitrosamines

Clinical Features
- clinical suspicion
  - ulcer fails to heal
  - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious, or late onset of symptoms
  - postprandial abdominal fullness, vague epigastric pain
  - anorexia, or weight loss
  - burping, N/V, dyspepsia, and dysphagia
  - hepatomegaly, epigastric mass (25%)
  - hematemesis fecal occult blood, melena, and iron-deficiency anemia
- metastasis
  - peritoneum, ovarian, liver, lung, and brain

Investigations
- OGD and biopsy; consider EUS to assess pre-operative T-stage and N-stage
- CT chest/abdomen/pelvis (for metastatic workup see Table 7)

Table 6. TNM Classification System for Staging of Gastric Carcinoma (AJCC/IUCC 2010)

Signs of Metastatic Gastric Carcinoma
- Virchow’s node: left supraclavicular node
- Blumer’s shelf: mass in pouch of Douglas
- Krukenberg tumour: metastases to ovary
- Sister Mary Joseph node: umbilical metastases
- Irish’s node: left axillary nodes

Treatment
- adenocarcinoma
  - proximal lesions
    - total gastrectomy and Roux-en-Y esophagojejunostomy
  - distal lesions
    - distal gastrectomy: wide margins, en bloc removal of omentum and lymph nodes with Roux-en-Y or Billroth II reconstruction
  - palliation
    - limited gastric resection or endoscopic stenting to decrease bleeding and relieve obstruction, enables the patient to eat
    - radiation therapy
    - studies are showing larger role for adjuvant/ neoadjuvant and palliative chemotherapy
- lymphoma
  - *H. pylori* eradication, chemotherapy ± radiation, and surgery in limited cases (perforation, bleeding, and obstruction)
Gastrointestinal Stromal Tumour

Epidemiology
- Most common mesenchymal neoplasm of GI tract
- Derived from interstitial cells of Cajal (cells associated with Auerbach's plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
- 75-80% associated with tyrosine kinase (c-KIT) mutations
- Most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
- Typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anaemia
- Often discovered incidentally on CT, laparotomy, or endoscopy

Risk Factors
- Carney's triad: GISTs, paraganglioma, and pulmonary chondroma
- Type IA neurofibromatosis

Investigations
- Pre-operative biopsy (endoscopic ultrasound): controversial, but useful for indeterminate lesions
- Not recommended if index of suspicion for GIST is high
- Percutaneous biopsy is NOT recommended due to high friability and risk of peritoneal spread

Treatment
- Surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
- Localized GIST
- Surgical resection with preservation of intact pseudocapsule
- Lymphadenectomy NOT required, as GISTs rarely metastasize to lymph nodes
- Consider adjuvant treatment with imatinib (Gleevec) or high-risk GIST (large, >4 cm with significant mitotic activity)
- Advanced disease (i.e. metastases to liver and/or peritoneal cavity)
- Palliative intent chemotherapy with imatinib
- Metastectomy may be considered for liver limited disease

Prognosis
- Risk of metastatic potential depends on
  - Tumour size (worse if >10 cm)
  - Mitotic activity (worse if >5 mitotic figures or 50/hpf)
  - Degree of nuclear pleomorphism
  - Location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
- Metastases to liver, omentum, peritoneum; nodal metastases rare

Bariatric Surgery

- Weight reduction surgery for morbid obesity
- Indications: BMI ≥40 without illness or BMI ≥35 with 1+ serious comorbidity (e.g. DM, CAD, sleep apnea, or severe joint disease)

Surgical Options
- Malabsorptive/restrictive
  - Laparoscopic Roux-en-Y gastric bypass (most common)
  - Staple off small gastric pouch (restrictive) with Roux-en-Y limb to pouch (malabsorptive) with dumping syndrome physiology most effective, higher complication rates
- Restrictive
  - Laparoscopic adjustable gastric banding
  - Silicone band around fundus creates pouch, adjustable through port under skin
  - Laparoscopic vertical sleeve gastrectomy
  - Vertical stapled small gastric pouch
- Malabsorptive
  - Bilipancreatic diversion with duodenal switch
  - Gastrectomy, enterointerostomy, duodenal division closure, and duodenoenterostomy

Complications
- Perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
- Obstruction at enterointerostomy (see Complications of Gastric Surgery)
- Staple line dehiscence
- Dumping syndrome
- Cholelithiasis due to rapid weight loss (20-30%)
- Band abscess (if long-term)
Complications of Gastric Surgery

- most resolve within 1 yr

Alkaline Reflux Gastritis
- duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
- treatment
  - medical: H2-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
  - surgical: conversion of Billroth I or II to Roux-en-Y

Afferent Loop Syndrome
- accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
- clinical features
  - early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
- treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

Dumping Syndrome
- early: 15 min post-prandial
  - etiology
    - hyperosmotic chyme released into small bowel (fluid accumulation and jejunal distention)
  - clinical features
    - post-prandial symptoms
    - epigastric fulness or pain, emesis, nausea, diarrhea, palpitations, dizziness, tachycardia, diaphoresis
  - treatment
    - small multiple low carbohydrate, low fat, and high protein meals and avoidance of liquids with meals
    - last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
- late: 3 h post-prandial
  - etiology: large glucose load leads to large insulin release and hypoglycemia
  - treatment: small snack 2 h after meals

Blind-Loop Syndrome
- bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
- clinical features
  - anemia/weakness, diarrhea, malnutrition, abdominal pain, and hypocalcemia
- treatment: broad-spectrum antibiotics, and surgery (conversion to Billroth I)

Postvagotomy Diarrhea
- up to 25%
- bile salts in colon inhibit water resorption
- treatment: medical (cholestyramine), and surgical (reversed interposition jejunal segment)

SMALL INTESTINE

Small Bowel Obstruction

Mechanical Small Bowel Obstruction

Pathophysiology
- obstruction → gas and fluid (swallowed or GI secretions) accumulate proximal to site of obstruction and distal decompression → intestinal activity increases to overcome obstruction → colicky pain and diarrhea (initially)
- bowel wall edema and disruption of normal bowel absorptive function can lead to increased intraluminal fluid and transudative fluid loss into peritoneal cavity, electrolyte disturbances
- increase intramural pressure can lead to impaired microvascular perfusion leading to intestinal ischemia and necrosis (strangulated bowel obstruction)
Etiology

Table 7. Common Causes of SBO

<table>
<thead>
<tr>
<th>Etiology</th>
<th>Intraluminal</th>
<th>Extramural</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intussusception</td>
<td>Crohn’s</td>
<td>Adhesions from previous surgeries (75% SBO)</td>
</tr>
<tr>
<td>Gallstones</td>
<td>Radiation stricture</td>
<td>Incarcerated hernia</td>
</tr>
<tr>
<td>Bezoars</td>
<td>Adenocarcinoma</td>
<td>Peritoneal carcinomatosis</td>
</tr>
</tbody>
</table>

- **three types**
  - partial SBO: only a portion of intestinal lumen is occluded, allows passage of some gas & fluid, low risk of strangulation
  - complete SBO: the lumen of the intestine is occluded, no passage of gas or stool, at higher risk of strangulation
  - closed-loop obstruction: segment of intestine is obstructed both proximally and distally (e.g. volvulus), leading to rapid rise in intraluminal pressure from gas and fluid that cannot escape, high risk of strangulation due to bowel wall ischemia

**Risk Factors**
- prior abdominal or pelvic surgery
  - abdominal wall or groin hernia
  - history of malignancy
  - prior radiation

**Clinical Features**
- 1) distinguish mechanical obstruction from ileus; 2) determine etiology of obstruction; 3) recognize partial from complete SBO; 4) differentiate simple from complicated (e.g. strangulated) obstruction
- symptoms: colicky abdominal pain, nausea/vomiting, obstipation
  - vomiting is more prominent with proximal than distal
  - more feculent vomitus suggests more established obstruction because of bacterial overgrowth
  - continue passage of gas and/or stool 6-12 h after onset of symptoms suggest partial than complete obstruction
- signs: abdominal distention (most prominent if obstruction at distal ileum), hyperactive proceeding to minimal bowel sound
- strangulated obstruction: abdominal pain disproportionate to physical exam findings suggest intestinal ischemia
  - may have tachycardia, localized abdominal tenderness
  - fever, marked leukocytosis, and lactate acidosis

**Investigations**
- radiological
  - abdominal x-ray (3 views): triad of dilated small bowel (>3 cm in diameter), air-fluid levels on upright film, paucity of air in colon (high sensitivity, low specificity as ileus and LBO can present similarly)
  - CT: discrete transition zone with proximal bowel dilation, distal bowel decompression, and intraluminal contrast does not pass the transition zone
    - most importantly to rule out ischemic bowel/strangulation: pneumatosis intestinalis (free air in bowel wall) and thickened bowel wall, air in portal vein, free intraperitoneal fluids, and differential wall enhancements (poor uptake of IV contrast into the wall of the affected bowel)
  - other
    - less used: upper GI series/small bowel series (if no cause apparent, i.e. no hernias, and no previous surgeries)
    - may consider U/S or MRI in pregnant patients
- laboratory
  - may be normal early in disease course
  - creatinine, and hematocrit to assess degree of dehydration
  - fluid, and electrolyte abnormalities; metabolic alkalosis due to frequent emesis; amylase elevated
  - if strangulation: leukocytosis with left shift, elevated lactate (late signs)

**Treatment**
- IV isotonic fluid resuscitation + urine output monitoring with catheter
  - SBO related vomiting and decrease PO intake leads to volume depletion
  - NG tube in the stomach for gastric decompression; decrease nausea, distention, and risk of aspiration from vomiting
- Partial SBO/Crohn’s/Carcinomatosis: conservative management with fluid resuscitation and NG tube decompression
  - 48 h of watchful waiting; if no improvement or develops complications, surgery
- Complete SBO, if no clinical features of strangulation, short course of conservative management with fluid resuscitation and NG tube decompression with frequent re-examination by surgical team
  - duration of observation varies from hours to a few days
  - if SBO fails to resolve, or if symptoms of strangulation develop, then surgery

**MUST DO**
- Rule out CRC in constipated patient
- Send for TURP in patient with BPH (treat intra-abdominal HTN)

**Increased Risk of Perforation with Distention as seen on Abdomen Imaging**
- Small bowel ≥3 cm
  - Distal colon ≥6 cm
  - Proximal colon ≥3 cm
  - Cecum ≥12 cm

**Patients presenting with a SBO in setting of “virgin” abdomen should have surgery ASAP**
  - EXCEPTION: malignant obstruction from history and imaging

**In a non-virgin abdomen – adhesional SBOs resolve spontaneously with NGT decompression 70% of time**

**Top 3 Causes of SBO (in order)**
- ABC
  - Adhesions
  - Bulge (hernias)
  - Cancer (neoplasms)

**Causes of SBO**
- SHAHING
  - Stricture
  - Hernia
  - Adhesions
  - Volvulus
  - Intussusception/BDO
  - Neoplasm
  - Gallstones
• High risk for strangulation based on clinical symptoms: urgent surgery to prevent irreversible ischemia
  • early post operative SBO: if bowel function does not return within 3-5 d after surgery; usually partial, extended conservative therapy (2-3 wk) with bowel rest, fluids, and TPN is appropriate surgery if presence of peritonitis or complete SBO demonstrated

Prognosis
• related to etiology; mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

Prevention
• open surgery has four fold increase in risk of SBO in 5 yr compared to laparoscopic surgery

**Paralytic Ileus**

Pathogenesis
• temporary, reversible impairment of intestinal motility; mostly frequently caused by:
  • abdominal operations, infections and inflammation, medications (opiates, anesthetics, psychotropics), and electrolyte abnormalities
  • passing gas is the most useful indicator
• NOT the same as intestinal pseudo-obstruction
  • chronic pseudo-obstruction refers to specific disorders that affect the smooth muscle and myenteric plexus, leading to irreversible intestinal dysmotility

Clinical Features
• symptoms and signs of intestinal obstruction without mechanical obstruction
  • bowel sounds are diminished or absent (in contrast to initial hyperactive bowel sounds in SBO)

Investigations
• routine post-operative ileus: expected, no investigation needed
• if ileus persists or occurs without abdominal surgery
  • review patient medications (especially opiates)
  • measure serum electrolyte to monitor for electrolyte abnormalities (including extended electrolytes like Mg, Calabour, PO4)
  • CT scan to rule out abscess or peritoneal sepsis, or to exclude complete mechanical obstruction

Treatment
• most important: NPO + fluid resuscitation
• NGT decompression, correct causative abnormalities (e.g. sepsis, medications, electrolytes), consider TPN for prolonged ileus
• post-operative: gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
• current interest in novel therapies such as gum chewing and pharmacologic therapy (e.g. alvimopan, an opioid antagonists)

**Intestinal Ischemia**

Etiology
• acute
  • arterio-occlusive mesenteric ischemia (AOMI)
    • thrombotic, embolic, and extrinsic compression (e.g. strangulating hernia)
  • non-occlusive mesenteric ischemia (NOMI)
    • mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
  • mesenteric venous thrombosis (MVT)
    • consider hypercoagulable state (i.e. rule out malignancy), and DVT (prevents venous outflow)
• chronic: usually due to atherosclerotic disease – look for CVD risk factors
• can lead to occlusion in vessels that supplies the small intestine and the large intestine

Clinical Features
• acute: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, and sepsis
• chronic: postprandial pain (from mesenteric angina), fear of eating, and weight loss
• common sites: SMA supplied territory, "watershed" areas of colon – splenic flexure, left colon, and sigmoid colon

Pain "out of keeping with physical findings" is the hallmark of early intestinal ischemia
Investigations
- laboratory: leukocytosis (non-specific), and lactic acidosis (late finding)
- amylase, lactate, CK, and ALP can be used to observe progress
- hypercoagulability workup if suspect venous thrombosis
- AXR: portal venous gas, intestinal pneumatosis, and free air if perforation
- contrast CT: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, and pneumatosis
CT angiography is the gold standard for acute arterial ischemia

Treatment
- fluid resuscitation, correct metabolic acidosis, NPO, NGT decompression of stomach, and prophylactic broad-spectrum antibiotics; avoid vasoconstrictors and digitalis
- exploratory laparotomy
- angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, and percutaneous transluminal angioplasty ± stent
- segmental resection of necrotic intestine
- assess extent of viability; if extent of bowel viability is uncertain, a second look laparotomy 12-24 h later is mandatory

Tumours of Small Intestine

BENIGN TUMOURS
- 10x more common than malignant
- usually asymptomatic until large
- most common sites: terminal ileum, and proximal jejunum
- polyps
  - adenomas
  - hamartomas
  - FAP (see Familial Colon Cancer Syndromes, GS33)
- juvenile polyps
- other: leiomyomas, lipomas, and hemangiomas

| Staging System     | TNM | TNM | Ann Arbor |

### Short Gut Syndrome

**Definition**
- reduced surface area (length) of small bowel causing insufficient intestinal absorption leading to diarrhea, malnutrition, and dehydration

**Etiology**
- acute mesenteric ischemia: resection of large amount of bowel at once
- Crohn's disease: cumulative resections
- malignancies

**Prognostic Factors**
- residual small bowel length, residual colon length (reabsorption of water and electrolytes and some reabsorption of nutrients), condition of the remnant small bowel (healthier bowel facilitate better reabsorption), presence of ileocecal valve (delay transition into colon leading to more reabsorption)
- resection of ileum is less tolerated than resection of jejunum (ileum reabsorbs bile salt and vitamin B12)

**Therapy**
- medical
  - TPN: replenish lost fluid and electrolytes in diarrhea
  - HT2R antagonist or PPI to prevent gastric acid secretion
  - antimitoty agent to prolong transit time in the small intestine
  - consider octreotide to decrease GI secretion and cholestyramine for bile acid absorption
- surgical: non-transplant
  - to slow transit time: small bowel segmental reversal, intestinal valve construction, or electrical pacing of small bowel
  - to increase intestinal length:
    - LITT (longitudinal intestinal lengthening and tailoring) procedure
    - STEP (serial transverse enteroplasty procedure) in dilated small bowels
- surgical: transplant
  - indication: life-threatening complication from intestinal failure or long-term TPN
  - liver failure, thrombosis of major central veins, recurrent catheter-related sepsis, recurrent severe dehydration

### Abdominal Hernia

- see Hiatus Hernia, GS13

**Definition**
- defect in abdominal wall causing abnormal protrusion of intra-abdominal contents

**Epidemiology**
- M:F = 9:1
- lifetime risk of developing a hernia: males 20-25%, females 2%
- frequency of occurrence: 50% indirect inguinal, 25% direct inguinal, 8-10% incisional (ventral), 5% femoral, and 3-8% umbilical
- most common surgical disease of males

**Risk Factors**
- activities which increase intra-abdominal pressure
  - obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, and heavy lifting
  - congenital abnormality (e.g. patent processus vaginalis, and indirect inguinal hernia)
  - previous hernia repair, especially if complicated by wound infection
  - loss of tissue strength and elasticity (e.g. hiatus hernia, aging, and repetitive stress)
Abdominal Hernia

Clinical Features
- mass of variable size
- tenderness worse at end of day, relieved with supine position or with reduction
- abdominal fullness, vomiting, constipation
- transmits palpable impulse with coughing or straining

Investigations
- physical examination usually sufficient
- U/S ± CT (CT required for obturator hernias, internal abdominal hernias, and Spigelian and/or femoral hernias in obese patients)

Classification
- complete: hernia sac and contents protrude through defect
- incomplete: partial protrusion through the defect
- internal hernia: sac herniating into or involving intra-abdominal structure
- external hernia: sac protrudes completely through abdominal wall
- strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
- requires emergency repair
- incarcerated hernia: irreducible hernia, not necessarily strangulated
- Richter’s hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
- a strangulated Richter’s hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
- sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)

Anatomical Types
- groin
- indirect and direct inguinal, femoral
- pantalloen: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
- epigastric: defect in linea alba above umbilicus
- incisional: ventral hernia at site of wound closure, may be secondary to wound infection
- other: Littre’s (involving Meckel’s), Amyand’s (containing appendix), lumbar, obturator, peristomal, umbilical, Spigelian (ventral hernia through linea semilunaris)

Complications
- incarceration
- strangulation
- small, new hernias more likely to strangulate
- femoral >> indirect inguinal > direct inguinal
- intense pain followed by tenderness
- intestinal obstruction, gangrenous bowel, sepsis
- surgical emergency
- DO NOT attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous
- will cause closed loop SBO – and EMERGENCY

Treatment
- surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis, if asymptomatic can delay surgery
- repair may be done open or laparoscopic and may use mesh for tension-free closure
- most repairs are now done using tension free techniques – a plug in the hernial defect and a patch over it or patch alone
- observation is acceptable for small asymptomatic inguinal hernias

Post-Operative Complications
- recurrence (15–20%)
  - risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-operative functional status (ASA ≥3 – see Anesthesia and Perioperative Medicine, A4), associated medical conditions: type 2 DM, hyperlipidemia, immunosuppression, and any comorbid conditions increasing intra-abdominal pressure
  - less common with mesh/"tension-free" repair
  - scrotal hematoma (3%)
  - painful scrotal swelling from compromised venous return of testes
  - deep bleeding: may enter retroperitoneal space and not be initially apparent
  - difficulty voiding
  - nerve entrapment
  - ilioinguinal (causes numbness of inner thigh or lateral scrotum)
  - genital branch of genitofemoral (in spermatic cord)
  - stenosis/occlusion of femoral vein
  - acute leg swelling
  - ischemic colitis

Shouldice Technique vs. Other Open Techniques for Inguinal Hernia Repair
Cochrane DB Syst Rev 2012;4:CD001543
Purpose: To evaluate the efficacy and safety of the Shouldice technique to other non-laparoscopic techniques.
Results/Conclusions: 16 RCTs or quasi-randomized RCTs with 2,568 hernias (1,121 mesh, 1,488 non-mesh). The recurrence rate with Shouldice was higher than mesh (OR 3.80, 95% CI 1.69-7.26) but lower than non-mesh (OR 0.62, 95% CI 0.45-0.85). There was no difference in chronic pain or complications. In conclusion, with respect to recurrence rates, Shouldice hernorrhaphy is the best non-mesh technique, although inferior to mesh. However, it is also more time consuming and results in slightly longer post-operative hospital stays.

Watchful Waiting vs. Repair of Inguinal Hernia in Minimally Symptomatic Men: A Randomized Controlled Trial
JAMA 2006;295:295-292
Purpose: To compare pain and the physical component score (PCS) of the Short Form 36 Version 2 survey at 2 yr in men with minimally symptomatic inguinal hernias treated with watchful waiting or surgical repair.
Methods: RCT of 1275 men in (n=384 watchful waiting, n=891 surgical repair) followed up for 2-4.5 yr. Watchful-waiting patients were followed up at 6 mo and annually and watchful for hernia symptoms; repair patients received standard open tension-free repair and were followed up at 3 and 6 mo and annually. The main outcome was pain and discomfort interfering with usual activities at 2 yr and change in PCS from baseline to 2 yr. Secondary outcomes were complications, patient-reported pain, functional status, as well as levels, and satisfaction with care.
Results: Primary intention-to-treat outcomes were similar a 2 yr for watchful waiting vs. surgical repair; pain limiting activities (5.1% vs. 2.2%, respectively), p=0.04 (corrected); PCS (improvement over baseline, 0.29 points vs. 0.13 points, p=0.05). Twenty-three percent of patients assigned to watchful waiting crossed over to receive surgical repair (increase in hernia-related pain was the most common reason offered). 1% assigned to receive repair crossed over to watchful waiting. Self-reported pain in watchful-waiting patients crossed over improved after repair. Occurrence of post-operative hernia-related complications was similar in patients who received repair as assigned and in watchful-waiting patients who crossed over. One watchful-waiting patient (0.3%) experienced acute hernia incarceration without strangulation within 2 yr; a second had acute incarceration with bowel obstruction at 4 yr; with a frequency of 1.8/1,000 patients/year of patients to bowel up for as long as 4.5 yr.
Conclusion: Watchful waiting is an acceptable option for men with minimally symptomatic inguinal hernias. Delaying surgical repair until symptoms increase is safe because acute hernia incarcerations occur rarely.

Outcomes of Laparoscopic vs. Open Repair of Primary Ventral Hernias
Purpose: To compare outcomes (surgical site infection (SSI), hernia recurrence and bulging) of patients undergoing laparoscopic ventral hernia repair (LVRH) versus open ventral hernia repair (OVHR).
Results/Conclusions: 79 patients with LVRH matched to 79 patients with OVHR with mesh with a median follow-up of 56 mo. LVRH was associated with fewer SSS (7.6% vs. 34.4%) but more cases of bulging (21.3% vs. 1.3%) and post-surgery hernia (2.5% vs. 0.0%). No differences in recurrence were observed.

Appendix

Appendicitis

Epidemiology
- 6% of population, M>F
- 80% between 5-35 yr of age

Pathogenesis
- luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
- etiology
  - children or young adult: hyperplasia of lymphoid follicles, initiated by infection
  - adult: fibrosis/stricture, fecolith, or obstructing neoplasm
  - other causes: parasites, or foreign body

Clinical Features
- most reliable feature is progression of signs and symptoms
- low grade fever (38°C), rises if perforation
- abdominal pain then anorexia, N/V
- classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney’s point
  - due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
  - McBurney’s sign
- signs
  - inferior appendix: McBurney’s sign (see sidebar), Rovsing’s sign (palpation pressure to left abdomen causes McBurney’s point tenderness). McBurney’s sign is present whenever the opening of the appendix at the cecum is directly under McBurney’s point; therefore McBurney’s sign is present even when the appendix x is in different locations
  - retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
  - pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)
- complications
  - perforation (especially if >24 h duration)
  - abscess, phlegmon
  - sepsis

Figure 12. Schematic of inguinal (direct and indirect) and femoral hernias

© Laura E. Smith 2013
Investigations
- Laboratory
  - mild leukocytosis with left shift (may have normal WBC counts)
  - higher leukocyte count with perforation
  - β-hCG to rule out ectopic pregnancy
- Imaging
  - U/S: may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but CANNOT rule out appendicitis (if >6 mm, SENS/SPEC/PPV/PV 98%)
  - CT scan: thick wall, enlarged (>6 mm), wall enhancement, appendicolith, and inflammatory changes – overall accuracy 94-100%, optimal investigation

Treatment
- Hydrate, correct electrolyte abnormalities
- Appendectomy (gold standard)
  - laparoscopic vs. open (see sidebar)
- Complications: intra-abdominal abscess, appendiceal stump leak
- Perioperative antibiotics:
  - cefazolin + metronidazole if uncomplicated peri-operative dose is adequate
  - Consider treatment with post-operative antibiotics for perforated appendicitis
  - For patients who present with an abscess (palpable mass or phlegmon on imaging and often delayed diagnosis with symptoms for >4-5 d), consider radiologic drainage + antibiotics x 14 d ± interval appendectomy once inflammation has resolved (controversial)
  - Recent research supports antibiotic only treatment as reasonable for uncomplicated appendicitis, with 10-20% recurrence rates
  - Colonoscopy in the elderly to rule out other etiology (neoplasm)

Prognosis
- Mortality rate: 0.08% (non-perforated), 0.5% (perforated appendicitis)

Inflammatory Bowel Disease

- See Gastroenterology, G19

Principles of Surgical Management
- Can alleviate symptoms, address complications, and improve quality of life
- Conserve bowel: resect as little as possible to avoid short gut syndrome
- Perioperative management
  - Optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
  - Hold immunosuppressive therapy pre-operative, provide pre-operative stress dose of corticosteroid if patient had recent steroid therapy, taper steroids post-operative
  - VTE prophylaxis: LMWH or heparin in the elderly
- See Gastroenterology, G19

Crohn’s Disease

- See Gastroenterology, G20

Treatment
- Surgery is for symptom management, it is NOT curative, but over lifetime ~70% of Crohn’s patients will have surgery
- Indications for surgical management
  - Failure of medical management
  - SBO (due to stricture/inflammation): indication in 50% of surgical cases
  - Abscess, fistula (enterocolic, vesiculovaginal, ileal cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), and perianal disease
  - Surgical procedures
    - Resection and anastomosis/stoma if active or subacute inflammation, perforation, or fistula
    - Resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
    - Strictureplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

Complications of Treatment
- Short gut syndrome (diarrhea, steatorrhea, malnutrition)
- Fistulas
- Gallstones (if terminal ileum resected, decreased bile salt resorption → increased cholesterol precipitation)
- Kidney stones (loss of calcium in diarrhea → increased oxalate absorption and hyperoxaluria → stones)

Effect of Delay to Operation on Outcomes in Adults with Acute Appendicitis
- Arch Surg 2010;145:886-892
- Purpose: To examine the effect of delay to appendectomy on morbidity and mortality among adults with appendicitis
- Method: Retrospective cohort study with the main exposure being time to operation, and main outcomes being 30 d overall morbidity and serious morbidity/mortality
- Results: Of 32,782 patients in the study, 75.2%, 15.1%, and 9.8% underwent surgeries within 6 h, 6-12 h, and >12 h of admission, respectively
  - Differences in operative duration and length of post-operative stay were statistically significant but not clinically meaningful. No significant differences were observed in adjusted overall morbidity or serious morbidity/mortality. Duration from surgical admission to anesthetic induction was not predictive in regression models for either outcomes.
- Conclusions: Delay of appendectomy for acute appendicitis among adults does not adversely affect outcomes.

Antibiotics vs. Placebo for Prevention of Post-Operative Infection After Appendectomy
- Purpose: To determine the effectiveness of antibiotics against post operative infections after appendectomy
- Method: Meta-analysis of randomized controlled trials (RCTs) and controlled clinical trials (CCTs), on both adults and children, in which any antibiotic regime was compared to placebo in patients undergoing appendectomy for suspected appendicitis. The main outcomes of interest were wound infection, intra-abdominal abscess, length of hospital stay, and mortality.
- Results: 45 studies (n = 9,576) were included
  - Treatment with antibiotics decreased wound infection and abscess rates
- Conclusion: Various prophylactic antibiotic regimens are effective in preventing post-operative complications after appendectomy.

Laparoscopic vs. Open Appendectomy
- Cochrane DB Syst Rev 2010;10:CD001546
- Laparoscopic Surgery
  - Wound infection less likely
  - Intra-abdominal abscesses 2x more likely
  - Reduced pain on POD #1
  - Reduced hospital stay by 1.1 d
  - Sooner return to normal activity, work, and sport
  - Costs outside hospital are reduced
- Open Surgery
  - Shorter duration of surgery
  - Lower operation costs
- Overview
  - Diagnostic laparoscopy and laparoscopic appendectomy appear to be advantageous over open appendectomy, particularly for young female patients and obese patients.

Laparoscopic Surgery
- Reduced duration of hospital stay
- Reduced post-operative pain
- Reduced wound infection
- Reduced abscess and sepsis
- Reduced morbidity and mortality
- Sooner return to normal activity, work, and sport
- Reduced costs outside hospital
- Reduced length of hospital stay
- Reduced incidence of wound infection and abscess
- Reduced mortality

Open Surgery
- Increased duration of hospital stay
- Increased post-operative pain
- Increased wound infection
- Increased abscess and sepsis
- Increased morbidity and mortality
- Delayed return to normal activity, work, and sport
- Increased costs outside hospital
- Increased length of hospital stay
- Increased incidence of wound infection and abscess
- Increased mortality

Antibiotics
- Reduced duration of hospital stay
- Reduced post-operative pain
- Reduced wound infection
- Reduced abscess and sepsis
- Reduced morbidity and mortality
- Sooner return to normal activity, work, and sport
- Reduced costs outside hospital
- Reduced length of hospital stay
- Reduced incidence of wound infection and abscess
- Reduced mortality

Placebo
- Increased duration of hospital stay
- Increased post-operative pain
- Increased wound infection
- Increased abscess and sepsis
- Increased morbidity and mortality
- Delayed return to normal activity, work, and sport
- Increased costs outside hospital
- Increased length of hospital stay
- Increased incidence of wound infection and abscess
- Increased mortality
Prognosis
- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), strictureplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr

Ulcerative Colitis
- see Gastroenterology, G21

Treatment
- indications for surgical management
  - failure of medical management (including inability to taper steroids)
  - complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
  - reduce cancer risk (1-2% risk per yr after 10 yr of disease)
- surgical procedures
  - proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
  - proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
  - colectomy and IPAA ± rectal mucosectomy
  - in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

Complications of Treatment
- early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomotic leak
- late: stricture, anal fistula/abscess, pouchitis, poor anorectal function, reduced fertility

Prognosis
- mortality: 5% over 10 yr
- total proctocolectomy will eliminate risk of cancer
- perforation of the colon is the leading cause of death from ulcerative colitis

LARGE INTESTINE

Large Bowel Obstruction

Mechanical Large Bowel Obstruction

Etiology

Table 11. Common Causes of LBO

<td>IBD stricture</td>
<td>Hernias (sigmoid colon in a large groin hernia)</td>
</tr>
<tr>
<td></td>
<td>Radiation stricture</td>
<td></td>
</tr>
</tbody>
</table>

Clinical Features (unique to LBO)
- open loop (10-20%)
  - incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical presentation similar to SBO
- closed loop (80-90%) (dangerous)
  - competent ileocecal valve, resulting in proximal and distal occlusions
  - massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

Treatment
- surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
- volvulus requires sigmoidoscopic or endoscopic decompression followed by operative reduction if unsuccessful
  - if successful, consider interval sigmoid resection on same admission
- cecal volvulus can be a true volvulus or a cecal ‘basicle’ (cecum folds anteriorly to the ascending colon producing a flap valve occlusion to cecal emptying) – both need surgical treatment

Findings in Crohn’s
- “Cobblestoning” on mucosal surface due to edema and linear ulcerations
- “Skip lesions”: normal mucosa in between
- “Creeping fat”: mesentery infiltrated by fat
- Granulomas: 25-30%

Findings in Ulcerative Colitis
- Patients usually present with diarrhea (± blood in their stool)
- Associated symptoms include colicky abdominal pain, urgency, tenesmus, and incontinence
- Presence of extra-intestinal manifestations
  - Endoscopically, there is loss of vascular markings, erythema, granularity of mucosa, petechiae, exudates, edema, erosions, and spontaneous bleeding
  - Biopsy features included crypt abscesses, crypt branching, shortening and disarray, and crypt atrophy
- Inflammation is continuous and usually involves rectum

Top 3 Causes of LBO (in order)
- Cancer
- Diverticulitis
- Volvulus

In a patient with clinical LBO consider impending perforation when:
- Cecum ≥ 12 cm in diameter
- Tenderness present over cecum
**Prognosis**
- overall mortality: 10%
- cecal perforation + feculent peritonitis: 20% mortality

**Functional LBO: Colonic Pseudo-Obstruction (Ogilvie’s Syndrome)**

**Definition**
- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel

**Associations**
- most common: trauma, infection, and cardiac (MI, CHF)
- disability (long-term debilitation, chronic disease bed-bound nursing home patients, and paraplegia), drugs (narcotic use, laxative abuse, and polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, and diffuse carcinomatosis)

**Clinical Features**
- most prominent is abdominal distention (acute or graduate over 3-7 days)
- abdominal pain, nausea and vomiting, constipation/diarrhea
- watch out for fever, leukocytosis, and presence of peritoneal signs

**Investigations**
- AXR: cecal dilatation – if diameter ≥12 cm, increased risk of perforation

**Treatment**
- treat underlying cause
- NPO, NGT
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia, or failure of conservative management

**Prognosis**
- most resolve with conservative management
Diverticular Disease

Definitions
- diverticulum: abnormal sac-like protrusion from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided

Figure 13. Diverticular disease – cross-sections of true and false diverticuli

Diverticulosis

Epidemiology
- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

Pathogenesis
- risk factors:
  - lifestyle: low-fibre diet (predispose to motility abnormalities and higher intraluminal pressure),
    inactivity, and obesity
  - muscle wall weakness from aging and illness (e.g. Ehler-Danlos, Marfan’s)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly
  where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

Clinical Features
- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications:
  - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
  - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive LGIB
  - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, and abdominal pain

Treatment
- uncomplicated diverticulosis: high fibre, education
- diverticular bleed
  - initially workup and treat as any LGIB
  - if hemorrhage does not stop, resect involved region

Diverticulitis

Epidemiology
- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

Pathogenesis
- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and
  focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula, or
  obstruction can ensue
- poor containment results in free perforation and peritonitis
**Clinical Features**

- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, N/V, and urinary symptoms (with adjacent inflammation)
- low grade fever, mild leukocytosis common, and occult or gross blood in stool rarely coexist with acute diverticulitis complications (25% of cases)
  - abscess: palpable, tender abdominal mass
  - fistula: colovesical (most common), coloenteric, colovaginal, c and olocutaneous
  - colonic obstruction: due to scarring from repeated inflammation
  - perforation: generalized peritonitis (feculent vs. purulent)
  - recurrent attacks rarely lead to peritonitis

**Investigations**

- AXR, upright CXR
  - localized diverticulitis (ileus, thickened wall, SBO, and partial colonic obstruction)
  - free air may be seen in 30% with perforation and generalized peritonitis
- CT scan (test of choice): very useful for assessment of severity and prognosis; usually done with rectal contrast
  - 97% sensitive, 99% specific
  - increased soft tissue density within pericolic fat secondary to inflammation, diverticula secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), and fistula
  - 10% of diverticulitis cannot be distinguished from carcinoma
- elective evaluation: establish extent of disease and rule out other diagnoses (polyps, and malignancy) AFTER resolution of acute episode
  - colonoscopy or barium enema and flexible sigmoidoscopy

**Treatment**

- uncomplicated: conservative management
- outpatient: clear fluids only until improvement and antibiotics (e.g. cefazolin and metronidazole) 7-10 d to cover gram negative rods and anaerobes (e.g. B. fragilis)
- hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, or fail to improve outpatient management
- treat with NPO, IVF, and IV antibiotics (e.g. IV ceftriaxone + metronidazole)
- indications for surgery
  - unstable patient with peritonitis
  - Hinchey stage 3-4
  - after 1 attack if immunosuppressed
  - consider if recurrent episodes of diverticulitis (3 or more), recent trend is toward conservative management of recurrent mild/moderate attacks
  - complications: perforation, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
- surgical procedures
  - for unstable patient or complex cases: Hartmann procedure
  - colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo
  - for more stable patients with Hinchey stage III and IV acute diverticulitis, colonic resection, primary anastomosis + diverting loop ileostomy is becoming more common, with benefits for mortality and morbidity
  - laparoscopic peritoneal lavage with drain placement near the affected colon, in addition to IV antibiotics (NO resection) has been proposed for Hinchey stage III

**Prognosis**

- mortality rates: 6% for purulent peritonitis, 35% for feculent peritonitis
- recurrence rates: 13-30% after first attack, 30-50% after second attack

Colorectal Neoplasms

Colorectal Polyps

Definition
- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk)

Epidemiology
- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70

Clinical Features
- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, and mucus
- usually detected during routine endoscopy or familial/high risk screening

Pathology
- non-neoplastic
  - hyperplastic: most common non-neoplastic polyp
  - mucosal polyps: small <5 mm, no clinical significance
  - inflammatory pseudopolyps: associated with IBD, no malignant potential
  - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, and carcinoids
- neoplastic
  - lipomas, leiomyomas, carcinoids
  - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
    - malignant risk due to associated adenomas (large bowel)
  - low malignant potential → most spontaneously regress or autoamputate
  - adenomas: premalignant, considered carcinoma in situ IF high grade dysplasia
  - some may contain invasive carcinoma (“malignant polyp” – 3-9%): invasion into submucosa
    - malignant potential: villous > tubulovillous > tubular

Investigations
- colonoscopy is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscopy if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

Treatment
- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- indications for segmental resection for malignant polyps: 1) lymphovascular invasion; 2) tumour budding; 3) positive resection margin; 4) poorly differentiated cells; 5) evidence of regional or distant metastases on staging. Most of these cases are usually discussed at multi-disciplinary tumour boards
- follow-up endoscopy 1 yr later, then every 3–5 yr

Familial Colon Cancer Syndromes

FAMILIAL ADENOMATOUS POLYPOSI

Pathogenesis
- autosomal dominant inheritance, mutation in adenomatous polyposis coli (APC) gene on chromosome 5q21
Clinical Features
- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
- extracolonic manifestations
  - carcinoma of large bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, and small bowel
  - congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
  - virtually 100% lifetime risk of colon cancer (because of number of polyps)
- variants
  - Gardner's syndrome: FAP + extra-intestinal lesions (sebaceous cysts, osteomas, desmoid tumours)
  - Turcot syndrome: FAP + CNS tumours (childhood cerebellar medulloblastoma)

Investigations
- genetic testing (80-95% sensitive, 99-100% specific)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery (see Figure 15); consider upper endoscopy to evaluate for peripapillary tumours

Treatment
- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

HEREDITARY NON-POLYPsis COLORECTAL CANCER – LYNCH SYNDROME

Pathogenesis
- autosomal dominant inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1)
- resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

Clinical Features
- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr; lifetime risk 70-80% (M>F)
  - HNPCC I: hereditary site-specific colon cancer
  - HNPCC II: cancer family syndrome – high rates of extracolonic tumours (endometrial, ovarian, hepatobiliary, small bowel)

Diagnosis
- Amsterdam Criteria
  - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
  - 2 or more generations involved
  - 1 case must be diagnosed before 50 yr old
  - FAP is excluded
  - genetic testing (80% sensitive) – colonoscopy mandatory even if negative
  - refer for genetic screening individuals who fulfill EITHER the Amsterdam Criteria OR the revised Bethesda Criteria
  - colonoscopy (starting age 20) annually
  - surveillance for extracolonic lesions

Referral Criteria for Genetic Screening
- To confirm the diagnosis of FAP (in patients with ≥100 colorectal adenomas)
- To provide pre-symptomatic testing for individuals at risk for FAP (1st degree relatives who are ≥10 yr old)
- To confirm the diagnosis of attenuated FAP (in patients with ≥20 colorectal adenomas)

Treatment
- total colectomy and ileorectal anastomosis with annual proctoscopy

Colorectal Carcinoma

Epidemiology
- 4th most common cancer (after lung, prostate, and breast), 2nd most common cause of cancer death

Risk Factors
- most patients have no specific risk factors
- age ≥50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, or family history of CRC
- colonic conditions
  - adenomatous polyps (especially if >1 cm, villous, multiple)
  - IBD (especially UC; risk is 1-2%/yr if UC ≥10 yr)
  - previous colorectal cancer (also gonadal or breast)
  - diet (increased fat, red meat, and decreased fibre) and smoking
  - DM and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)

Staging for CRC
- I T1,N0,M0
- II T2,N0,M0
- III T3-4,N0,M0
- IV T4,Nx,M1

APR removes distal sigmoid colon, rectum, and anus; permanent end colostomy required
LAR removes distal sigmoid and rectum with anastomosis of distal colon to anus

Pathogenesis
- adenoma-carcinoma sequence; rarely arise de novo

Clinical Features
- often asymptomatic
- hematochezia/melena, abdominal pain, and change in bowel habits
- others: weakness, anemia, weight loss, palpable mass, and obstruction
- 20% patients have distant metastatic disease at time of presentation
- spread
  - direct extension, lymphatic, and hematogenous (liver most common, lung, bone, and brain; tumour of distal rectum → IVC → lungs)
  - peritoneal seeding: oarry, and Blumer's shelf (pelvic cul-de-sac)

</table>

Investigations
- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema (“apple core” lesion) + sigmoidoscopy
- if a patient is FOBT +ve, or has microcytic anemia or has a change in bowel habits, do colonoscopy
- laboratory: CBC, urinalysis, liver enzymes, liver function tests, carcinogenic embryonic antigen (CEA) (pre-operative for baseline, > 5 ng/mL have worse prognosis)
- staging: CT chest/abdo; laboratory: CBC, urinalysis; if a patient is FOBT +ve, or has microcytic anemia, do colonoscopy
- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema (“apple core” lesion) + sigmoidoscopy
- if a patient is FOBT +ve, or has microcytic anemia or has a change in bowel habits, do colonoscopy

Treatment
- colon cancer
  - wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
  - curative: wide resection of lesion (5 cm margins) with nodes (>12) and mesentery
  - metastatic lesions confined to the liver can be resected with curative intent
  - palliative: if distant spread, local control for hemorrhage or obstruction
  - care is taken to not spread tumour by unnecessary palpation
  - cancer-bearing portion of colon is removed according to vascular distribution of segment
  - adjuvant chemotherapy (5-FU or oral capecitabine with oxaliplatin) for stage III and is considered in select stage II patients

- rectal cancer
  - choice of operation depends on individual case; types of operations
    - low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins (~2 cm); uses technique of total mesorectal excision
    - abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
    - transanal minimally invasive surgery (TAMIS): local excision for select T1 lesions only
    - palliative procedures involve proximal diversion with an ostomy for obstruction and radiation for bleeding or pain
    - adjuvant therapy
      - combined neoadjuvant chemoradiation therapy followed by post-operative adjuvant chemotherapy for stages II and III
      - adjuvant therapy

Follow-Up
- currently there are no data suggesting optimal follow-up
- combination of periodic CT chest/abdomen/pelvis, CEA, and colonoscopy is recommended
- CEA to monitor for initial response to treatment, and for surveillance (q6mo)

Other Conditions of the Large Intestine

Angiodysplasia

Definition
- vascular malformation: focal submucosal venous dilatation and tortuosity

Clinical Features
- most frequently in right colon of patients >60 yr old
- bleeding typically intermittent, rarely massive, and not usually hypotensive (melena, anemia, and occult blood positive stools)

Investigations
- colonoscopy: cherry red spots, branching pattern from central vessel
- angiography: early-filling vein, vascular tuft, and delayed emptying vein; rarely active bleeding
- RBC technetium-99 scan
- barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

Treatment
- none if asymptomatic
- cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

Volvulus

Definition
- rotation of segment of bowel about its mesenteric axis
- sigmoid (65%), cecum (30%), transverse colon (3%), and splenic flexure (2%)
- 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

Risk Factors
- age (50% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
- high fibre diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, and institutionalization (less frequent evacuation of bowels)

Clinical Features
- symptoms due to bowel obstruction (see Large Bowel Obstruction, GS29) or intestinal ischemia (see Intestinal Ischemia, GS23)
- colicky abdominal pain, persistence of pain between spasms, abdominal distention, and vomiting

Investigations
- AXR (classic findings): "omega", "bent inner-tube", "coffee-bean" signs
- barium/Gastrografin® enema: "ace of spades" (or "bird's beak") appearance due to funnel-like luminal tapering of lower segment towards volvulus
- sigmoidoscopy or colonoscopy as appropriate
- CT: "whirl pattern" of mesenteric vessels twisting about the volvulus axis

Treatment
- initial supportive management (same as initial management for bowel obstruction (see Large Bowel Obstruction, GS29)
- cecum
  - nonsurgical
    - may attempt colonoscopic detorsion and decompression; successful 15-20% of cases
  - surgical
    - right colectomy + ileotransverse colonic anastomosis
- sigmoid
  - nonsurgical
    - decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
    - subsequent elective surgery recommended (50-70% recurrence)
  - surgical
    - surgical resection with or without primary anastomosis
    - indications: strangulation, perforation, or unsuccessful endoscopic decompression
**Toxic Megacolon**

**Pathogenesis**
- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

**Etiology**
- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (*C. difficile*, *Salmonella*, *Shigella*, and *Campylobacter*), viral (cytomegalovirus), and parasitic (*E. histolytica*)

**Clinical Features**
- infectious colitis usually presents for >1 wk before colonic dilatation
- diarrhea ± blood (sudden improvement of diarrhea may signify onset of megacolon)
- abdominal distention, tenderness, ± local/general peritoneal signs (suggest perforation)
- triggers: hypokalemia, constipating agents (opioids, antidepressants, loperamide, and anticholinergics), barium enema, and colonoscopy

**Diagnostic Criteria**
- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- three of: fever, HR >120, WBC >10.5, and anemia
- one of: fluid and electrolyte disturbances, hypotension, or altered LOC

**Investigations**
- CBC (leukocytosis with left shift, and anemia from bloody diarrhea), electrolytes, elevated CRP, and ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

**Treatment**
- NPO, NGT, stop constipating agents, correct fluid and electrolyte abnormalities, and transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis, and anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD, and metronidazole for *C. difficile*)
- indications for surgery (50% improve on medical management)
  - worsening or persisting toxicity or dilation after 48-72 h
  - severe hemorrhage, perforation
  - high lactate and WBC, especially for *C. difficile*
- procedure: subtotal colectomy + end ileostomy (may be temporary, with second operation for re-anastomosis later)

**Prognosis**
- average 25-30% mortality

---

**Fistula**

**Definition**
- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, and entero-enteric)

**Etiology**
- foreign object erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD [Crohn's > UC], and diverticular disease)
- iatrogenic/surgery (e.g. post-operative anastomotic leak, and radiation)
- congenital, trauma
- neoplastic

**Investigations**
- U/S, CT scan, fistulogram
- measure amount of drainage from fistula

**Treatment**
- decrease secretion: octreotide/somatostatin/omeprazole
- surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis
Stomas

Definition
- an opening of the GI tract onto the surface of the abdomen wall
- stomas can be constructed as either end stomas: the proximal end of the GI tract forms the stoma and the distal end of the GI tract is not part of the stoma, or loop stomas: a loop of the GI tract is brought up to the skin and the anti-mesenteric surface of the bowel is matured as a stoma. The proximal and distal GI tract remain in continuity

Ileostomy
- usually positioned in RLQ; ileum is brought through rectus abdominus muscles
- indications: after proctocolectomy for ulcerative colitis, in some cases of Crohn’s disease or familial polyposis
- conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
- continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

Colostomy
- indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
- colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
- most common permanent colostomy is a sigmoid colostomy – expels stool once per day, no appliance required
- chronic paracolostomy hernia is a common complication

Complications (10%)
- obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
- peri-ileostomy abscess and fistula
- skin irritation
- prolapse or retraction
- diarrhea (excessive output), which may lead to fluid, electrolyte and nutritional imbalances

Anorectum

Hemorrhoids

Etiology
- vascular and connective tissue complexes form a plexus of dilated veins (cushion)
- internal: superior hemorrhoidal veins, above dentate line, portal circulation
- external: inferior hemorrhoidal veins, below dentate line, systemic circulation

Risk Factors
- increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal HTN, heavy lifting
Clinical Features and Treatment

- **internal hemorrhoids**
  - engorged vascular cushions usually at 3, 7, 11 o’clock positions (patient in lithotomy position)
  - PAINLESS rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, and rectal fullness
    - **1st degree**: bleed but do not prolapse through the anus
      - treatment: high fibre/bulk diet, sitz baths, steroid cream, paromoxine (Anusol®), rubber band ligation, sclerotherapy, and photocoagulation
    - **2nd degree**: bleed, prolapse with straining, and spontaneous reduction
      - treatment: rubber band ligation, and photocoagulation
    - **3rd degree**: bleed, prolapse, and requires manual reduction
      - treatment: same as 2nd degree, but may require closed hemorrhoidectomy
    - **4th degree**: bleed, permanently prolapsed, and cannot be manually reduced
      - treatment: closed hemorrhoidectomy

- **external hemorrhoids**
  - dilated venules usually mildly symptomatic
    - PAIN after bowel movement, associated with poor hygiene
    - medical treatment: dietary fibre, stool softeners, steroid cream (short course), paromoxine (Anusol®), and avoid prolonged straining
  - thrombosed hemorrhoids are very painful
    - resolve within 2 wk, may leave excess skin = perianal skin tag
    - treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

Anal Fissures

**Definition**

- tear of anal canal below dentate line (very sensitive squamous epithelium)
- 90% posterior midline, 10% anterior midline
- if off midline: consider other possible causes such as IBD, STIs, TB, leukemia, or anal carcinoma
- repetitive injury cycle after first tear
  - sphincter spasm occurs preventing edges from healing and leads to further tearing
  - ischemia may ensue and contribute to chronicity

**Etiology**

- forceful dilation of anal canal: large, hard stools and irritant diarrheal stools
- tightening of anal canal secondary to nervousness/pain leads to further tearing
- others: habitual use of stool bulking agents, and childbirth

**Clinical Features**

- acute fissure
  - very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
  - treatment is conservative: stool softeners, bulking agents, and sitz baths (heals 90%)
- chronic fissure (anal ulcer)
  - triad: fissure, sentinel skin tags, and hypertrophied papillae
  - treatment
    - stool softeners, increased fibre intake, and sitz baths
    - topical nitroglycerin or calcium channel blocker (nifedipine): increases local blood flow, promotes healing, and relieves sphincter spasm
    - lateral internal anal sphincterotomy (most effective): objective is to relieve sphincter spasm → increases blood flow and promotes healing; but 5% chance of fecal incontinence therefore not commonly done
    - alternative treatment: botulinum toxin: inhibits release of acetylcholine (ACh), reducing sphincter spasm
Anorectal Abscess

Definition
- infection typically originating within an obstructed anal crypt which forms an abscess
- common bacterial: *E. coli*, *Proteus*, *Streptococci*, *Staphylococci*, *Bacteroides*, and anaerobes

Clinical Features
- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralevator), or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

Treatment
- I&D
  - curative in 50% of cases
  - 50% develop anorectal fistulas
  - may require antibiotics if diabetic, heart murmur, or cellulitis

Fistula-In-Ano

Definition
- fistula from anal canal to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

Etiology
- see Fistula, GS37
- same processes that lead to the formation of an anal abscess
- other causes: post-operative, trauma, anal fissure, malignancy, and radiation proctitis

Clinical Features
- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

Treatment
- identification
  - internal opening
    - Goodsall's rule
      - fistulas originating anterior to a transverse line through the anus will have a straight course and exit anteriorly, whereas those originating posterior to the transverse line will begin in the midline and have a curved tract
  - fistulous tract
    - probing or fistulography under anesthesia
• surgery
  • fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
  • low lying fistula (does not involve external sphincter) → primary fistulotomy
  • high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract
    • promotes drainage
    • promotes fibrosis and decreases incidence of incontinence
    • delineates anatomy
    • usually done to spare muscle
  • alternative for high lying fistula → LIFT (ligation of Intersphincteric fistula tract) procedure
    • access fistula between sphincter muscles, sparing them

Post-Operative
• sitz baths, irrigation, and packing to ensure healing proceeds from inside to outside

Complications
• recurrence
• rarely fecal incontinence

## Pilonidal Disease

### Definition
• pilo = hair, nidal = nest; cyst or abscess near or on the intergluteal cleft of the sacrococcygeal area containing hair and skin debris

### Epidemiology
• occurs most frequently in young men age 15-35 yr; rare in >50 yr

### Etiology
• obstruction of the hair follicles in this area → formation of cysts, sinuses, or abscesses
• associated with occupations that require prolonged sitting, obesity, and high amounts of body hair

### Clinical Features
• asymptomatic or chronically itchy until acutely infected, then pain/tenderness, purulent discharge, and increased moisture near the tailbone

### Treatment
• acute abscess
  • I&D (often performed by primary care doctors)
  • wound packed open
  • 40% develop chronic pilonidal sinuses
• surgery
  • indication: failure of healing after I&D, recurrent disease, or complex disease
  • pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

## Rectal Prolapse

### Definition
• protrusion of some or all of rectal mucosa through external anal sphincter

### Epidemiology
• extremes of ages: <5 yr old and >5th decade
• 85% women

### Etiology
• lengthened attachment of rectum secondary to constant straining
• 2 types
  1. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
  2. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
    • first degree: prolapse includes mucocutaneous junction
    • second degree: without involvement of mucocutaneous junction
    • third degree (internal intussusception): prolapse is internal, concealed, or occult

### Risk Factors
• gynecological surgery
• chronic neurologic/psychiatric disorders affecting motility
Clinical Features
- extrusion of mass with increased intra-abdominal pressure
- difficulty in bowel regulation
  - tenesmus, constipation, fecal incontinence
- permanently extruded rectum with excoriation, ulceration, and constant soiling
- may be associated with urinary incontinence or uterine prolapse

Treatment
- Type I
  - conservative: gentle manual reduction of prolapsed area, especially in children
  - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II
  - conservative: reduce if possible
  - surgery: abdominal, perineal, and transsacral approaches

Anal Neoplasms

ANAL CANAL

Squamous Cell Carcinoma of Anal Canal (Above Dentate Line)
- most common tumour of anal canal (75%)
- anus prone to human papillomavirus (HPV) infection, therefore at risk for anal squamous intra-epithelial lesions (ASIL)
  - high grade squamous intra-epithelial lesion (HSIL) and low grade squamous intra-epithelial lesion (LSIL) terminology used
- clinical features: anal bleeding, pain, mass, ulceration, and pruritus; 25% asymptomatic
- treatment: chemotherapy ± radiation ± surgery
- prognosis: 80% 5-yr survival

Malignant Melanoma of Anal Canal
- 3rd most common site for primary malignant melanoma after skin, eyes
- aggressive, distant metastases common at time of diagnosis
- treatment: wide excision or APR ± chemoradiation
- prognosis: <5% 5-yr survival

ANAL MARGIN
- clinical features and treatment as for skin tumours elsewhere
- squamous and basal cell carcinoma, Bowen’s disease (SCC in situ), and Paget’s disease

Liver

Liver Abscesses

Etiology
- types
  - pyogenic (bacterial): most common etiology; most often polymicrobial – *E. coli, Klebsiella, Proteus, Strep. milleri*
  - parasitic (amoebic): *Entamoeba histolytica, Echinococcal cyst*
  - fungal: *Candida*
  - sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

Clinical Features
- fever, malaise, chills, anorexia weight loss, abdominal pain, and nausea
- RUQ tenderness, hepatomegaly, and jaundice

Investigations
- leukocytosis anemia, elevated liver enzymes, and echinococcal serology
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S, and MRI

Treatment
- treat underlying cause
- bacterial abscesses generally will treat initially with antibiotics, and add surgical or percutaneous drainage and IV antibiotics for larger abscesses (initially ceftriaxone + metronidazole or piperacillin/tazobactam)
- consider potential source of sepsis (e.g. biliary source, infected tumour)

Prognosis
- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, and malnutrition
Neoplasms

BENIGN LIVER NEOPLASMS

Hemangioma (cavernous)

- pathogenesis: most common benign hepatic tumour; results from malformation of angioblastic fetal tissue
  - risk factors: F:M = 3:1
  - clinical features
    - usually small and asymptomatic
    - consumptive coagulopathy if giant (in children)
  - investigations
    - contrast CT (well-demarcated hypodense mass with peripheral enhancement on arterial phase with centripetal filling on delayed phases), U/S (homogenous hyperechoic mass), MRI
  - treatment
    - usually none

Focal Nodular Hyperplasia

- pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at centre of nodule
- risk factors: female, age 20-50
- clinical features: asymptomatic, rarely grows or bleeds, and no malignant potential
- investigations: central stellate scar on CT scan; MRL biopsy may be required
- treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential)
  - if confirmed to be FNH → no treatment required

Adenoma

- definition: benign glandular epithelial tumour
- risk factors: female, age 20-50, estrogen (OCP, pregnancy), and obesity
- clinical features: asymptomatic, rarely grows or bleeds, and no malignant potential
- investigations: CT (well-demarcated masses, often heterogeneous enhancement on arterial phase, isodense on venous phase without washout of contrast), U/S, MRI, biopsy often needed
- treatment
  - stop anabolic steroids or OCP
  - excise especially if large (>5 cm), due to risk of transformation to hepatocellular carcinoma and spontaneous rupture/hemorrhage

MALIGNANT LIVER NEOPLASMS

Primary

- most commonly hepatocellular carcinoma (HCC) and cholangiocarinomas
- others include angiosarcoma, hepatoblastoma, and hemangioendothelioma
- epidemiology: 3rd leading cause of cancer death worldwide, 9th in United States; highest in Africa, China, Taiwan
- risk factors
  - chronic liver inflammation: cirrhosis from any cause, chronic hepatitis B (inherently oncogenic) and hepatitis C, hemochromatosis, α1-antitrypsin deficiency, and non-alcoholic steatohepatitis
  - medications: OCPs (3x increased risk), steroids
  - smoking, alcohol, Betel nuts
  - chemical carcinogens ( aflatoxin, microcystin, and vinyl chloride – associated with angiosarcoma)
- clinical features
  - RUQ discomfort, and right shoulder pain
  - jaundice, weakness, weight loss, and fever (if central tumour necrosis)
  - hepatomegaly, bruise, and hepatic friction rub
  - ascites with blood (sudden intra-abdominal hemorrhage)
  - paraneoplastic syndromes – hypoglycemia, hypercalcemia, erythrocytosis, and watery diarrhea
  - metastasis: lung, bone, brain, and peritoneal seeding
- investigations
  - elevated ALP, bilirubin, and α-fetoprotein (80% of patients)
  - U/S (poorly-defined margins with internal echos), triphasic CT (enhancement on arterial phase and washout on portal venous phase), and MRI
  - liver enzyme and liver function tests: AST, ALT, ALP, bilirubin, albumin and INR
- treatment
  - cirrhosis is a relative contraindication to tumour resection due to decreased hepatic reserve
  - surgical: resection (10% of patients have resectable tumours)
  - liver transplant: may use bridging therapy while awaiting transplant
  - absolute contraindications: extrahepatic disease, and vascular invasion
  - relative contraindications: dependent on liver transplant protocol based on staging criteria followed by transplant centre

Liver

- non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheater arterial chemoemobilization (TACE), chemotherapy (consider sorafenib for HCC; pre-operative chemotherapy for hepatoblastoma is standard of care), and radiotherapy
- prognosis
  - median survival: 6-20 mo
  - 5 yr survival: all patients – 5%; patients undergoing complete resection – 11-40%

Secondary
- metastases to the liver are the most common malignant tumours found in the liver
- etiology
  - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, and prostate
treatment
- depends on the primary cancer site and prognosis. Often liver metastases are a manifestation of Stage IV disease, and chemotherapy is indicated
- metastasectomy may be appropriate for some cancers
  - hepatic resection of metastatic colorectal liver metastases is standard of care as part of multi-modality treatment that includes chemotherapy if complete resection of the primary cancer and metastases is possible
  - prognosis following liver resection for colorectal metastases is an overall survival of 30-60% at 5 yr

*Leading cause in adults; **leading cause in children

Clinical Indications
- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially:
  - decompensated cirrhosis (ascites, esophageal variceal hemorrhage, spontaneous hepatic encephalopathy, coagulopathy, progressive jaundice, severe fatigue)
  - unresectable primary liver cancers
  - fulminating hepatic failure
  - end-stage liver disease with life expectancy <1 yr and if no other therapy is appropriate
  - suitable HCC not amenable to liver resection

Criteria for Transplantation
- Model for End-Stage Liver Disease (MELD): prognostic model to estimate 3 mo survival and disease severity if patient does not receive transplant; based on creatinine, bilirubin, INR; MELD scores from 6-40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: classification system to assess the prognosis and mortality of liver disease; patient must have ≥7 points (Class B)

Contraindications
- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr advanced cardiopulmonary disease
- active uncontrolled infection

Post-Operative Complications
- primary non-function (graft failure): urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: HTN, renal disease, DM, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

Prognosis
- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%

Secondary liver metastases are common in many cancers, with some studies showing a prevalence of 40-50% amongst patients with extrathoracic cancers. They commonly arise from breast, lung, and colorectal cancers. For metastases secondary to colorectal cancer, surgical resection offers the greatest likelihood of cure

| Table 19. Conditions Leading to Transplantation |

Living Liver Donors vs. Deceased Liver Donors
The right lobe of a living donor liver is transplanted into the recipient, whereas whole livers from deceased donors are transplanted orthotopically into the recipient.

Which Matters Most: Number of Tumours, Size of the Largest Tumour, or Total Tumour Volume?
Liver Transplant 2011;17:S58-66
Purpose: To determine if the size and/or number of hepatocellular carcinoma (HCC) nodules predict disease recurrence and survival after liver transplantation.
Methods: Systematic review and meta-analysis.
Results: 74 studies were included for analysis. Patients beyond the Milan criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the UCSF criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the Milan criteria but within the UCSF criteria had reduced overall and disease-free survivals. Overall and disease-free survivals were reduced for patients with larger tumour diameter, a 10 cm vs. <10 cm and a 8 cm vs. <8 cm, respectively. Similarly, patients with higher diameter of largest tumour nodule (≥3 cm vs. <3 cm) had reduced overall survival and higher recurrence. Overall and disease-free survivals were reduced and recurrence higher for patients with tumour size ≤5 cm vs. >5 cm. Mixed results were found regarding number of tumour nodules.
Conclusion: Tumour size and volume are important actors in survival after liver transplantation.

Living Donor Liver Transplantation vs. Deceased Donor Liver Transplantation for Hepatocellular Carcinoma: Comparable Survival and Recurrence
Liver Transplant 2012;18:315-322
Purpose: To compare the overall survival and hepatocellular carcinoma (HCC) recurrence rates after living donor liver transplantation (LDLT) versus deceased donor liver transplantation (DDLT) in a series of patients with HCC.
Methods: Study conducted between 1996 and 2009 at a single centre 345 patients with HCC undergoing liver transplantation.
Results: The overall survival rates at 1, 3, and 5 yr did not significantly differ between the LDLT and DDLT groups (p=0.62). Disease-free survival at 1, 3, and 5 yr did not differ between the groups (p=0.62). The recurrence rates at 1, 3, and 5 yr also did not differ between the two groups (p=0.56).
Conclusion: LDLT and DDLT lead to similar survival and recurrence rates.
Biliary Tract

Cholelithiasis

Definition
• the presence of gallstones

Pathogenesis
• imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
• excess hepatic cholesterol secretion relative to bile salts and lecithin → supersaturated cholesterol which precipitates as gallstones
• North America: cholesterol stones (80%), pigment stones (20%)

Risk Factors
• cholesterol stone
  ▪ obesity, age <50
  ▪ estrogens: female, multiparity, OCPs
  ▪ ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
  ▪ terminal ileal resection or disease (e.g. Crohn’s disease)
  ▪ impaired gallbladder emptying: starvation, TPN, DM
  ▪ rapid weight loss: rapid cholesterol mobilization and biliary stasis
• pigment stones (contain calcium bilirubinate)
  ▪ cirrhosis
  ▪ chronic hemolysis
  ▪ biliary stasis ( strictures, dilation, biliary infection)
  ▪ protective factors: statins, vitamin C, coffee, exercise

Clinical Presentation
• asymptomatic (80%)
  ▪ most do NOT require treatment
  ▪ consider cholecystectomy if: increased risk of malignancy (choledochal cysts, Caroli’s disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, and immunosuppression
• biliary colic (10-25%)
• cholecystitis
• choledocholithiasis (8-15%)
• cholangitis
• gallstone pancreatitis (see Acute Pancreatitis, GS51)
• gallstone ileus (0.3-0.5%)
• other: empyema of the gallbladder, liver abscess, and gallbladder perforation with bile peritonitis

Risk Factors for Cholesterol Stones
4Fs
Fat
Female
Fertile
Forties
Investigations
- Labs
  - CBC, LFTs, amylase, and lipase
- U/S: diagnostic procedure of choice
  - image for signs of inflammation, obstruction, and localization of stones
  - 95% specific for detecting stones
- HIDA scan (cholescintigraphy)
  - used less commonly
- IV technetium-99 radioisotope is excreted into bile, allowing visualization of the biliary tree
- does not visualize stones; diagnosis based on occluded cystic duct or CBD

Biliary Colic

Pathogenesis
- gallstone transiently impacted in cystic duct, no infection

Clinical Features
- an episode of steady, severe dull pain in the epigastrium or RUQ lasting minutes to hours (<6 h), crescendo-decrescendo pattern
- can present with chest pain, right shoulder tip pain, scapular pain
- N/V
- frequently occurs at night or after fatty meal, not after fasting
- no peritoneal findings, no systemic signs

Investigations
- normal blood work: CBC, electrolytes, LFTs, bilirubin, amylase
- U/S shows cholelithiasis, may show stone in cystic duct

Treatment
- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success)
  - complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, and vessel injury
  - laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
  - risk of open cholecystectomy higher in emergency situations

Acute Cholecystitis

Pathogenesis
- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no cholelithiasis in 5-10% (see Acalculous Cholecystitis, GS48)

Clinical Features
- often have history of biliary colic
- severe constant (>6hr) epigastric or RUQ pain, anorexia, N/V, and low grade fever (<38.5°C)
- focal peritoneal findings: Murphy's sign, palpable, and tender gallbladder (in 3%)
- Boas' sign: right subcapsular pain

Investigations
- blood work: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT, and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative
  - signs: gallbladder wall thickening >4 mm, edema (double-wall sign), gallbladder sludge, pericholecystic fluid, and sonographic Murphy's sign

Complications
- Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct
- empyema of gallbladder: supplicative cholecystitis, pus in gallbladder, and sick patient
- emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall, or pericholecystic space (risk in diabetic patient); organisms involved in secondary infection: E. coli, Klebsiella, Enterococcus
- gangrenous gallbladder (20%), perforation (2%): result in abscess formation or peritonitis
- cholecystoenteric fistula, from repeated attacks of cholecystitis, can lead to gallstone ileus

Treatment
- admit, hydrate, NPO, NGT (if persistent vomiting from associated ileus), analgesics once diagnosis is made
- antibiotics
  - cefazolin if uncomplicated cholecystitis
  - ERCP prior to surgery if US if CBD stones are present
  - MRCP ± ERCP if CBD is markedly dilated or CBD stones suspected

Early vs. Delayed Laparoscopic Cholecystectomy for Uncomplicated Biliary Colic
Cochrane DB Syst Rev 2013;6:CD007196
Study: To assess the benefits and harms of early vs. delayed laparoscopic cholecystectomy for patients with uncomplicated biliary colic due to gallstones.
Results: One trial with 75 participants, average age 43 yr. Early laparoscopic cholecystectomy (<24 h) vs. delayed (mean wait period 4.2 mo). The proportion of serious adverse events was lower in the early vs. delayed group (0% vs. 22.5%, respectively). There was a shorter hospital stay in the early group (MD -1.25 d, 95% CI -2.05 to -0.45) and a shorter operating time in the early group (MD -14.80 min, 95% CI -18.02 to -11.58). There was no difference in the proportion of patients requiring conversion to open cholecystectomy in the two groups.
Conclusion: Early laparoscopic cholecystectomy (<24 h) decreased morbidity during the waiting period for elective laparoscopic cholecystectomy, hospital stay and operating time.
• cholecystectomy
  • early (within 72 h) vs. delayed (after 6 wk)
  • equal morbidity and mortality
  • early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
  • emergent OR indicated if high risk, e.g., emphysematous
• laparoscopic is standard of care (convert to open for complications or difficult case)
• laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-operative pain, and increased risk of bile duct injury
• intra-operative cholangiography (IOC)
• indications: clarify bile duct anatomy, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct (>15 mm), and jaundice
• percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

### Acute Cholecystitis

**Definition**
- acute or chronic cholecystitis in the absence of stones

**Pathogenesis**
- typically due to gallbladder ischemia, and stasis

**Risk Factors**
- DM, immunosuppression, ICU admission, trauma patient, TPN, and sepsis

**Clinical Features**
- see *Acute Cholecystitis, GS47*
  - occurs in 20% of cases of acute cholecystitis

**Investigations**
- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see *Acute Cholecystitis*)
- CT or HIDA scan

**Treatment**
- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy

### Choledocholithiasis

**Definition**
- stones in CBD

**Clinical Features**
- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, and fluctuating jaundice
- primary vs. secondary stones
  - primary: formed in bile duct, indicates bile duct pathology (e.g., benign biliary stricture, sclerosing cholangitis, choledochal cyst, and CF)
  - secondary: formed in gallbladder (85% of cases in U.S.)

**Investigations**
- CBC: usually normal; leukocytosis suggests cholangitis
- LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), ALP, GGT later
- amylase/lipase: to rule out gallstone pancreatitis
- U/S: intra-/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
- MRCP (90% sensitive)
  - visualization of ampullary region, biliary and pancreatic anatomy
  - non-invasive diagnostic test of choice
- ERCP
  - CBD stones in periampullary region
  - diagnostic and therapeutic; removal of stones and sphincterotomy possible
- complications: retained stones, ERCP pancreatitis (1-2%), pancreatic or biliary sepsis

### Percutaneous Transhepatic Cholangiography
- percutaneous approach to the proximal biliary tree (i.e., intra-hepatic biliary system) via the hepatic parenchyma
- useful for proximal bile duct obstruction or when ERCP fails or not available
- requires prophylactic antibiotics

### Acalculous Cholecystitis

**Definition**
- acute or chronic cholecystitis in the absence of stones

**Pathogenesis**
- typically due to gallbladder ischemia, and stasis

**Risk Factors**
- DM, immunosuppression, ICU admission, trauma patient, TPN, and sepsis

**Clinical Features**
- see *Acute Cholecystitis, GS47*
  - occurs in 20% of cases of acute cholecystitis

**Investigations**
- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see *Acute Cholecystitis*)
- CT or HIDA scan

**Treatment**
- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy tube: critically ill or if general anesthetic contraindicated
Biliary Tract

- contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, and disease of right lower lung or pleura
- complications: bile peritonitis, chylothorax, pneumothorax, biliary sepsis, and hemobilia

Complications
- cholangitis, pancreatitis, biliary stricture, and biliary cirrhosis

Treatment
- treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

Acute Cholangitis

Pathogenesis
- obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration and biliary sepsis – may be life-threatening, especially in elderly

Etiology
- choledocholithiasis (60%), stricture, neoplasms (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), and biliary stent
- organisms: *E. coli*, *Klebsiella*, *Pseudomonas*, *Enterococcus* *B. fragilis*, and Proteus

Clinical Features
- Charcot's triad: fever, RUQ pain, and jaundice
- Reynold's pentad: fever, RUQ pain, jaundice, shock, and confusion
- may have N/V, abdominal distention, ileus, acholic stools, and tea-coloured urine (elevated direct bilirubin)

Investigations
- CBC: elevated WBC + left shift
- may have positive blood cultures
- LFTs: obstructive picture (elevated ALP, GGT, and conjugated bilirubin, mild increase in AST, ALT)
- amylase/lipase: rule out pancreatitis
- U/S: intra-/extra-hepatic duct dilatation

Treatment
- initial NPO, fluid and electrolyte resuscitation, ± NGT, IV antibiotics (treats 80%)
- biliary decompression
  - ERCP + sphincterotomy: diagnostic and therapeutic
  - PTC with catheter drainage: if ERCP not available or unsuccessful
  - laparotomy with CBD exploration and T tube placement if above fails
- all patients should also have a cholecystectomy, unless contraindicated

Prognosis
- suppurative cholangitis mortality rate: 50%

Gallstone Ileus

Pathogenesis
- repeated inflammation causes a cholecystoenteric fistula (usually duodenal) → large gallstone enters the GI track, impacting the ileocecal valve, causing a mechanical bowel obstruction (note: ileus is a misnomer in this context)

Clinical Features
- crampy abdominal pain, N/V, constipation/obstipation (see Large Bowel Obstruction, GS29)

Investigations
- AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, and air in biliary tree (pneumobilia) (40%)
- CT: biliary tract air, obstruction, and gallstone in intestine
- Rigler’s triad: pneumobilia, small bowel obstruction (partial or complete), and gallstone (usually in right iliac fossa)

Treatment
- fluid resuscitation, NGT decompression
- surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
- may close fistula surgically or manage expectantly (can resolve spontaneously)
- cholecystectomy is generally not performed
Carcinoma of the Gallbladder

Risk Factors
- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (Salmonella, Helicobacter), and abnormal pancreaticobiliary duct junction

Clinical Features
- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of open cholecystectomies 0 1% in laparoscopic cholecystectomies)
- many patients are asymptomatic until late
- local: non-specific RUQ pain, ± palpable RUQ mass
- Courvoisier’s gallbladder: an enlarged, often palpable gallbladder in a patient with carcinoma of the head of the pancreas; associated with jaundice due to obstruction of the CBD
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

Investigations
- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, and fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, good for staging, allows sampling of bile for cytology
- abdominal CT: polypoid mass, mural thickening, liver invasion, nodal involvement, and distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

Treatment
- if carcinoma of the gallbladder is suspected pre-operatively, an open cholecystectomy should be considered to avoid tumour seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy
- early metastasis: common to liver, lung, bone

Prognosis
- poor 5 yr survival (10%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

Cholangiocarcinoma

Definition
- malignancy of extra- or intrahepatic bile ducts

Risk Factors
- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, Clonorchis sinensis infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

Clinical Features
- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, and pale stools
- anorexia, weight loss, RUQ pain, Courvoisier’s sign (if CBD obstructed), hepatomegaly
- early ascites are uncommon, but commonly tumour grows into portal vein or hepatic artery
- Klatskin tumour: cholangiocarcinoma located at bifurcation of common hepatic duct

Investigations
- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

Treatment
- if resectable: biliary drainage and wide excision margin
- intra-hepatic lesions: liver resection
  - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
  - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
  - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)
- chemotherapy ± radiotherapy
- role for transplantation in selected patients with Klatskins tumours

Prognosis
- overall 5 yr survival: 15%

Efficacy of Neoadjuvant Chemoradiation, Followed by Liver Transplantation, for Perihilar Cholangiocarcinoma at 12 US Centres

Purpose: To determine the effectiveness of neoadjuvant chemoradiation and liver transplantation for unresectable perihilar cholangiocarcinoma and to determine the appropriateness of the United Network of Organ Sharing/Organ Procurement and Transplantation Network (UNOS/OPTN) criteria for model of end-stage liver disease (MELD) exception for patients with this disease.

Methods: Study conducted from 1993-2010 in 12 transplant centres. 287 patients included.

Results: Median follow-up was 2.5 yr. 43% of patients (n=122) died after a median of 1.2 yr from presentation, and of these, 60 died posttransplant. Post-transplant, 43 patients had recurrences and 62 died. Recurrence-free survival at 2, 5, and 10 yr were 78%, 68%, and 58%, respectively. Intention-to-treat survival rates at 2 and 5 yr were 68% and 50%, respectively. 25% of patients left the waiting list after a median of 48 mo. The waiting list drop-out rate increased by an average of 11.5% every 3 yr. Patients who received transplantation outside of the criteria for MELD exception or who had a malignancy within 5 yr had significantly worse recurrence-free survival compared to those who met the criteria (HR=2.98, 95% CI 1.79, 4.95). Recurrence-free survival at 5 yr was shorter for patients with tumours >/=3 cm vs. <3 cm (p<0.001).

Conclusions: Neoadjuvant chemoradiation and liver transplantation are effective treatments for unresectable perihilar cholangiocarcinoma. Furthermore, the UNOS/OPTN criteria for MELD exception appear to be appropriate.

Ranson’s Criteria

A. At admission
1. Age >55 yr
2. WBC >16 x 10^9/L
3. Glucose >11 mmol/L
4. LDH >350 IU/L
5. AST >250 IU/L

B. During initial 48 h
1. Hct drop >10%
2. BUN rise >1.8 mmol/L
3. Arterial PO2 <60 mmHg
4. Base deficit >4 mmol/L
5. Calcium <2 mmol/L
6. Fluid sequestration >1 L

C. Interpretation
  a2 = difficult course
  a3 = high mortality (>15%)
Pancreas

Acute Pancreatitis

- see Gastroenterology, G44

GALLSTONE PANCREATITIS (45% of Acute Pancreatitis)

Pathogenesis
- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

Clinical Features (Pancreatitis of Any Etiology)
- pain (epigastric pain radiating to back), N/V, ileus, peritoneal signs, jaundice, and fever
- Inglefinger's sign: pain worse when supine, and better when sitting forward
- may have coexistent cholangitis or pancreatic necrosis
- Ranson's criteria for determining prognosis of acute pancreatitis (see sidebar)
- physical exam may show: tachypnea, tachycardia, hypotension, abdominal distention and tenderness, Cullen's sign, and Grey Turner's sign

Investigations
- lipase (most Sn and Sp), elevated amylase (higher than alcoholic pancreatitis), and leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), and edematous pancreas
- CXR, AXR, and CT (if severe to evaluate for complications)

Treatment
- supportive: e.g. NPO, hydration, analgesia, and early enteric nutrition
- antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if CBD stone impacted or cholangitis
- surgical indications in acute pancreatitis (rare):
  - drain placement and debridement for necrotizing pancreatitis if refractory to medical management, if septic or in ICU without other sources of sepsis

Complications
- Local complications
  - acute fluid collections
  - walled-off pancreatic fluid collection/pseudocyst (>4 wk old)
  - abscess/infection, necrosis
- Systemic complications
  - splenic/mesenteric/portal vessel thrombosis
  - pancreatic ascites/pancreatic pleural effusion
  - DM (b/c pancreatic & insulin insufficiency)
  - ARDS/sepsis/multiorgan failure
  - coagulopathy/DIC
  - severe hypocalcemia

Chronic Pancreatitis

- see Gastroenterology, G45

Surgical Treatment
- treatment is generally medical
- indications for surgery
  - failure of medical treatment
  - debilitating abdominal pain
  - pseudocyst complications: persistence, hemorrhage, infection, and rupture
  - CBD obstruction (e.g. stricures), and duodenal obstruction
  - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
  - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
  - anatomical abnormality causing recurrent pancreatitis
- pre-operative CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options
  - endoscopic pancreatic duct decompression: less effective than surgery
  - extracorporeal shockwave lithotripsy: if pancreatic duct stones
  - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery

The hallmark of chronic pancreatitis is epigastric pain radiating to the back

The hallmark of chronic pancreatitis is epigastric pain radiating to the back
surgical options
- drainage procedures: only effective if ductal system is dilated
  - Pancreaticoduodenectomy (Whipple procedure) for cure <5% mortality
  - Total pancreatectomy: best option in absence of dilated duct

proximal disease: Whipple procedure (pancreaticoduodenectomy) – pain relief in 80%
distal disease: distal pancreatectomy ± Roux-en-Y pancreaticojejunostomy
total pancreatectomy: refractory disease
- islet cells autotransplantation can be used to control insulin-related morbidity
denervation of celiac ganglia and splanchnic nerves

WALLED-OFF PANCREATIC FLUID COLLECTIONS (PSEUDOCYST)
- localized fluid collections rich in pancreatic enzymes, with a non-epithelialized wall consisting of fibrous and granulation tissue
- complication of chronic and/or acute pancreatitis
- up to 40% resolve spontaneously
- cyst wall must be mature prior to drainage (4-6 wk)
- pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first

Treatment
- if asymptomatic: expectant management
- if symptomatic: choice of drainage procedure depends on location of fluid collection
  - surgical drainage: cystgastrostomy vs. cystoduodenostomy
  - percutaneous catheter drainage
  - surgical drainage: cystgastrostomy vs. cystenterostomy
  - resection
- consider biopsy of cyst wall to rule out cystadenocarcinoma

Pancreatic Cancer

Epidemiology
- fourth most common cause of cancer-related mortality in both men and women in Canada
  - M:F = 1.3:1, average age: 50-70

Risk Factors
- increased age
- smoking: 2.5x increased risk, most clearly established risk factor
- high fat/low fibre diets, heavy alcohol use
- obesity
- DM, chronic pancreatitis
- partial gastrectomy, cholecystectomy
- chemicals: betanaphthylamine, benzidine
- African descent

Clinical Features
- head of the pancreas (70%)
  - weight loss, obstructive jaundice, steatorrhea, and vague constant mid-epigastric pain (often worse at night, may radiate to back)
  - painless jaundice, pruritus, dark urine, pale stools, and Courvoisier’s sign
- body or tail of pancreas (30%)
  - tends to present later and usually inoperable (80% are unresectable at diagnosis)
  - weight loss, vague mid-epigastric pain
  - <10% jaundiced
  - sudden onset DM

Investigations
- serum chemistry is non-specific, can have elevated ALP and high bilirubin
- CA 19-9 (most useful serum marker of pancreatic cancer)
- U/S, CT (also evaluates metastasis and resectability) ± ERCP, MRI, EUS

Pathology
- ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- intraductal papillary mucinous neoplasm (IPMN)
- other: pancreatic neuroendocrine tumours (non-functional, insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma), mucinous cystic neoplasm (MCN), acinar carcinoma
- see Surgical Endocrinology, GS60 for functional pancreatic neuroendocrine tumours

Treatment
- resectable (10-20% of pancreatic cancer)
  - no involvement of liver, peritoneum, or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
  - Whipple procedure (pancreaticoduodenectomy) for cure <5% mortality
Pancreas

- distal pancreatectomy ± splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas
- adjuvant chemotherapy recommended (gemcitabine ± capecitabine, 5-FU/Leucovorin)
- locally advanced, borderline resectable
  - tumours that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
  - locally advanced, non-resectable (palliative → relieve pain, obstruction)
  - encasement of major vascular structures including arteries
  - most body/tail tumours are not resectable (due to late presentation)
  - relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure (choledochocoduodenostomy + gastroenterostomy)
  - palliative chemotherapy (gemcitabine + nab-paclitaxel, FOLFIRINOX) ± radiotherapy

**Prognosis**

- most important prognostic indicators are lymph node status, margin status, size >3 cm, perineural invasion (invasion of tumour into microscopic nerves of pancreas)
- overall 5 yr survival for all patients with pancreas cancer is 1%; following surgical resection 5 yr survival is 20%
- median survival for unresectable disease: 3-6 mo if metastatic, 8-12 mo if locally advanced at presentation

**Steps of a Whipple Resection (Pancreaticoduodenectomy)**

1. Assessment of metastatic disease (all peritoneal surfaces)
2. Mobilization of the duodenum and head of the pancreas
3. Identification of the superior mesenteric vein and mobilization of the pancreatic neck
4. Mobilization of the stomach; dissection of the hepatoduodenal ligament and choledochectomy
5. Division of the stomach: proximal jejenum, and CBD
6. Transection of the pancreatic neck and dissection of the uncinate process from the retroperitoneum
7. Restoration of gastrointestinal continuity: construction of a pancreaticojejunostomy, hepaticojejunostomy, gastrojejunostomy using a neo-duodenum

**Diagnostic Value of Serum Carbohydrate Antigen 19-9 in Pancreatic Cancer: A Meta-Analysis**

Tumour Biol 2014 [Epub ahead of print]

Summary: 11 studies with 2,316 patients were included in the analysis. The sensitivity of CA19-9 in the diagnosis of pancreatic cancer was found to be 0.8 (95% CI 0.77-0.82) and the specificity also 80% (95% CI 0.77-0.82) with a diagnostic odds ratio of 14.79 (95% CI 8.50-25.58). Overall, CA19-9 plays an important role in the diagnosis of pancreatic cancer.

Figure 26. Schematic of Whipple resection, showing the resected components
Spleen

Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr’s sign

Treatment

- non-operative
  - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
  - hemostatic control
  - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemothorax
- operative
  - Hemodynamically unstable patients with positive FAST will undergo operative surgical exploration
  - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
  - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
  - total splenectomy if patient unstable or high grade injury

Splenectomy

Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenic purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenic purpura (TTP), and sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIg

Complications

- short-term
  - injury to surrounding structures (e.g. gastric wall, tail of pancreas)
  - post-operative thrombocytosis, leukocytosis
  - thrombosis of portal, splenic, or mesenteric veins
  - subphrenic abscess
- long-term
  - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr old)
    - 50% mortality
    - prophylaxis with vaccinations, ideally 2 wk pre- or post-operative (pneumococcal, H. influenzae, and meningococcus)
    - liberal use of penicillin especially in children <6 yr old
  - splenosis: intra-abdominal "seeding" of splenic tissue during removal

Splenic Infarct

Pathophysiology

- splenic artery occlusion or oxygen-delivery insufficiency leading to parenchymal ischemia and necrosis
- can occur in sickle cell disease, thromboembolism, myelofibrosis, CML, hypercoagulable states
- patient can be asymptomatic or can have left-upper-quadrant pain (70%), N/V, fever, chills, and Kehr sign

Treatment

- non-operative: close follow-up, analgesia
- indications for splenectomy: complications such as rupture, abscess, persistent pseudocyst, bleeding, sepsis
### Benign Breast Lesions

**Three Categories**
1. nonproliferative
2. proliferative without atypia
3. atypical hyperplasia

**NONPROLIFERATIVE LESIONS**
- benign breast condition characterized by fibrous and cystic changes in the breast (fibrocystic changes/disease)
- most common: breast cysts
- other lesions include papillary apocrine change, epithelial-related calcifications and mild hyperplasia of the usual type
- no increased risk of breast cancer
- age 30 to menopause (and after if HRT used)
- clinical features
  - breast pain, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, and nipple discharge (straw-like, brown, or green)
- treatment
  - evaluation of breast mass (U/S, mammography as indicated) and reassurance
  - analgesia (ibuprofen, ASA)
  - for severe symptoms: OCP, danazol, bromocriptine

**PROLIFERATIVE LESIONS – WITHOUT ATYPIA**

<table>
<thead>
<tr>
<th>Lesion</th>
<th>Clinical Features</th>
<th>Diagnosis</th>
<th>Treatment</th>
<th>Risk of Breast Cancer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fibroadenoma</td>
<td>Most common breast tumour in women &lt;30 yr</td>
<td>Nodules: firm, rubbery, discrete, well-circumscribed, non-tender, mobile, hormone-dependent (unlike cysts); needle aspiration yields no fluid</td>
<td>Core or excisional biopsy; some times required if concerned about malignancy; U/S and FNA alone cannot differentiate fibroadenoma from Phyllodes tumour; Consider excision if size ≥3 cm and growing on serial U/S (≥6 mm x 2 yr is usual follow-up); if symptomatic, formed after age 35, or patient preference or features on core biopsy suggestive of a Phyllodes tumour</td>
<td>Increased if complex, adjacent atypia or strong family history of breast cancer</td>
</tr>
<tr>
<td>Intraductal Papilloma</td>
<td>Solitary intraductal benign polyp</td>
<td>Can present as nipple discharge (most common cause of spontaneous, unilateral, bloody nipple discharge = pathologic nipple discharge); breast mass, nodule on U/S</td>
<td>Surgical excision of involved duct to ensure no atypia</td>
<td>Can harbour areas of atypia or DDS</td>
</tr>
<tr>
<td>Usual Ductal Hyperplasia</td>
<td>Increased number of cells within the ductal space</td>
<td>Incidental finding on biopsy of mammographic abnormalities or breast masses</td>
<td>None required</td>
<td>Generally low risk, slightly increased if moderate or florid hyperplasia</td>
</tr>
<tr>
<td>Sclerosing Adenosis</td>
<td>Lobular lesion with increased fibrous tissue and glandular cells</td>
<td>Mass or mammographic abnormality</td>
<td>None required</td>
<td>Low risk</td>
</tr>
</tbody>
</table>

**Figure 27. Anatomy of the breast**

**Levels of Axillary Lymph Nodes**

- **Level I:** lateral to pectoralis minor
- **Level II:** deep to pectoralis minor
- **Level III:** medial to pectoralis minor

(higher level of nodal involvement = worse prognosis)

**DDx for Breast Mass**

- **Benign**
  - Fibrocystic changes
  - Fibroepithelial lesions (fibroadenoma most common; benign phyllodes also)
  - Fat necrosis
  - Papilloma/papillomatosis
  - Galactocele
  - Duct ectasia
  - Ductal/lobular hyperplasia
  - Sclerosing adenosis
  - Lipoma
  - Neurofibroma
  - Granulomatous mastitis (e.g. TB, granulomatosis with polyangiitis, sarcoidosis)
  - Abscess
  - Silicone implant

- **Malignant**
  - Breast cancer (likely invasive, DCIS rarely forms a breast mass)
  - Malignant phyllodes
  - Angiosarcoma (rare)
**ATYPICAL HYPERPLASIA**

- can involve ducts (atypical ductal hyperplasia) or lobules (atypical lobular hyperplasia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

**OTHER LESIONS**

**Fat Necrosis**
- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction, ± tenderness
- regresses spontaneously, but complete imaging ± biopsy to rule out carcinoma

**Mammary Duct Ectasia**
- obstruction of a subareolar duct (see Obstetrics, OB45)

**Abscess**
- lactational vs. non-lactational (periductal/subareolar) (see Obstetrics, OB45)

**Breast Cancer**

**Epidemiology**
- leading cancer diagnosis in women in North America, 2nd leading cause of cancer mortality in women
- 1 in 8 (12.9% lifetime risk) women in Canada will be diagnosed with breast cancer in their lifetime
- 1 in 30 women in Canada will die from breast cancer
- all age relative survival is 88%

**Risk Factors**
- gender (99% female)
- age (80% >40 yr old)
- personal history of breast cancer and/or prior breast biopsy (regardless of pathology)
- family history of breast cancer (greater risk if relative was first degree and premenopausal)
- high breast density, nulliparity, first pregnancy >30 yr, menarche <12 yr, or menopause >55 yr
- decreased risk with lactation, early menopause, and early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT use, >10 yr OCP use
- BRCA1 and BRCA2 gene mutations
- alcohol use, obesity, and sedentary lifestyle

**Male breast cancer (<1%)**
- most commonly invasive ductal carcinoma
- often diagnosed at later stages
- stage-for-stage similar prognosis to breast cancer in females
- consider genetic testing; most often hormone receptor positive

**Investigations**
- mammography
  - indications: screening guidelines (see Family Medicine, FM4)
  - findings indicative of higher risk of malignancy
    - mass that is poorly defined, spiculated border
    - microcalcifications
    - architectural distortion
    - interval mammographic changes
  - normal mammogram does not rule out suspicion of cancer based on clinical findings
- other radiographic studies
  - U/S: differentiate between cystic and solid
  - MRI: high sensitivity, low specificity. Use Annual MRI + Mammography for patients with 25% lifetime risk of breast cancer
  - galactogram/ductogram (for nipple discharge): identifies lesions in ducts
- metastatic workup indicated in Stage II-IV disease: bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), CT head (if specific neurological symptoms)
Diagnostic Procedures
- ‘triple test’ for diagnosis of breast cancer: clinical breast exam, imaging (U/S for <30 yr, mammography + U/S for > 30 yr), pathology (biopsy)
- needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
- U/S or mammography guided core needle biopsy (most common)
- excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

Genetic Screening
- consider testing for BRCA1/2 if:
  - patient diagnosed with breast AND ovarian cancer
  - strong family history of breast/ovarian cancer
  - family history of male breast cancer
  - young patient (<35 yr)
  - bilateral breast cancer in patients <50 yr

Staging
- patients are assigned a clinical stage pre-operatively (cTNM); following surgery the pathologic stage is determined (pTNM)
- clinical
  - tumour size by palpation, mammogram, U/S and/or MRI
  - nodal involvement by palpation, imaging
  - metastasis by physical exam, CXR, and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-operative if node-positive disease)
- pathological
  - tumour size and type (see Pathology)
  - grade: modified Bloom and Richardson score (I to III) – histologic, nuclear, and mitotic grade
  - number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, and sentinel lymph node biopsy (SLNB) positive/negative
  - tumour biology: estrogen receptor (ER), progesterone receptor (PR), and HER2/neu oncogene status
  - margins: for invasive breast cancer negative margin is sufficient, for DCIS prefer 2 mm margin
  - lymphovascular invasion (LVI)
  - extensive in situ component (EIC): DCIS in surrounding tissue
  - involvement of dermal lymphatics (inflammatory) – automatically Stage IIIb

Pathology

NON-INVASIVE

Ductal Carcinoma in situ (DCIS)
- proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
- 80% non-palpable, detected by screening mammogram
- risk of invasive ductal carcinoma in same breast up to 35% in 10 yr
- treatment
  - lumpectomy with wide excision margins + radiation (5-10% risk of invasive cancer)
  - mastectomy if large area of disease, high grade, or multifocal (risk of invasive cancer reduced to 1%)
  - possibly tamoxifen as an adjuvant treatment
  - 99% 5 yr survival
Lobular Carcinoma in situ (LCIS)
- neoplastic cells completely contained within breast lobule
- no palpable mass, and no mammographic findings; usually incidental finding on breast biopsy for another indication
- LCIS is a risk factor for invasive carcinoma (approximately 1%/yr)
- treatment
  - if diagnosed on core biopsy, excisional biopsy necessary to rule out malignancy
  - if diagnosed on excisional biopsy, wide excision not needed since LCIS if often multicentric and not managed as precursor lesion
  - clinical follow-up and surveillance
  - consider chemoprevention (e.g. tamoxifen)

INVASIVE
Invasive Ductal Carcinoma (most common 80%)
- originates from ductal epithelium and infiltrates supporting stroma
- characteristics: hard, scirrhous, infiltrating tentacles, and gritty on cross-section

Invasive Lobular Carcinoma (8-15%)
- originates from lobular epithelium
- 20% bilateral (i.e. more often than infiltrating ductal carcinoma)
- does not form microcalcifications, harder to detect mammographically (may benefit from MRI)

Paget’s Disease (1-3%)
- ductal carcinoma that invades nipple with scaling, and eczematoid lesion

Inflammatory Carcinoma (1-4%)
- ductal carcinoma that invades dermal lymphatics
- most aggressive form of breast cancer
- clinical features: erythema skin edema, warm, swollen, and tender breast ± lump
- peau d’orange indicates advanced disease (IIIb-IV)

Sarcomas: rare
- most commonly Phyllodes tumour, a variant of fibroadenoma with potential for malignancy
- can also be angiosarcomas – after previous radiation

Lymphoma: rare

Other
- papillary, medullary, mucinous, and tubular cancers
- generally better prognosis

<td>Primary treatment is systemic therapy i.e. chemotherapy and/or hormone therapy</td>
</tr>
</tbody>
</table>

* BC = breast conserving surgery; SLNB = sentinel lymph node biopsy
* If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient’s preference since choice of local treatment does not significantly affect survival if local control is achieved.
PRIMARY SURGICAL TREATMENT

Breast Conservation Surgery (BCS)
- lumpectomy must be combined with radiation for survival equivalent to mastectomy
- contraindications include
  - high risk of local recurrence e.g. extensive malignant-type calcifications on mammogram, and multifocal primary tumours
  - failure to obtain tumour-free margins after re-excision
  - not suitable for radiation therapy (pregnancy, previous radiation, and collagen vascular disease)
  - large tumour size relative to breast

Mastectomy
- radical mastectomy (rarely): removes all breast tissue, skin, pectoralis muscle, and axillary nodes
- modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
- simple mastectomy: removes all breast tissue and skin
- see Plastic Surgery, PL37 for breast reconstruction

Sentinel Lymph Node Biopsy (SLNB)
- perform in women with clinically node-negative invasive breast cancer and those with extensive DCIS who are undergoing mastectomy
- patients with clinically suspicious nodes should get U/S + FNA prior to decision to proceed with SLNB
technetium-99 ± blue dye injected at tumour site prior to surgery to identify sentinel node(s)
- intra-operative frozen section evaluated can be considered
- proceed with ALND if >3 positive nodes, with 1-3 nodes whole breast radiation therapy may be alternative
- 5% false negative rate

Axillary Lymph Node Dissection (ALND)
- perform in all patients with pathologic confirmation of nodal involvement (including positive SLNB as above)
- risk of arm lymphedema (10-15%) especially if getting radiation therapy, decreased arm sensation, and shoulder pain

ADJUVANT/NEOADJUVANT

Radiation
- indications
  - decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy
  - inoperable locally advanced cancer
  - axillary nodal radiation may be added if nodal involvement

Hormonal
- indications
  - ER positive plus node-positive or high-risk node-negative
  - SERM if premenopausal (e.g. tamoxifen) or aromatase inhibitors if postmenopausal (e.g. anastrozole); optimal duration 5-10 yr
  - ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), and androgens (e.g. fluoxymesterone) are other options
  - palliation for metastatic disease

Chemotherapy
- indications
  - ER negative plus node-positive or high-risk node-negative
  - ER positive and young age
  - stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
  - palliation for metastatic disease
  - for HER2 positive breast cancer, add trastuzumab ± pertuzumab to the chemotherapy regimen

FOLLOW-UP

Post-Treatment Follow-Up
- assessment and physical exam q3-6mo x 3 yr, q6-12mo x 2 yr, and annually thereafter
- following BCS mammography q6-12mo; can reduce to annual once stable, no other routine imaging
- women who receive tamoxifen should have regular gynecologic follow-up (increased risk of endometrial cancer)
Local/Regional Recurrence
- recurrence in treated breast or ipsilateral axilla
- 1% per yr up to maximum of 15% risk of developing contralateral malignancy
- 5x increased risk of developing metastases

Metastasis
- bone > lungs > pleura > liver > brain
treatment is palliative: hormone therapy, chemotherapy, radiation
- overall survival of metastatic breast cancer is 36-60 mo

Surgical Endocrinology

Thyroid and Parathyroid

- see Endocrinology, E20 and Otolaryngology, OT33

Thyroidectomy
- indications: thyroid cancer, symptomatic thyroid mass or goitre, and medically refractory Graves' or hyperthyroidism
- contraindications: uncontrolled severe hyperthyroidism (i.e. Graves') due to risk of intra-operative or post-operative thyroid storm
- pre-operative workup: thyroid U/S for thyroid nodules, FNA for large nodules, U/S of the neck for lesions suspicious for papillary or medullary thyroid cancer, CT neck useful to rule out extension, and vocal cord function
- complications: hypocalcemia secondary to hypoparathyroidism, recurrent/superior laryngeal nerve injury, neck hematoma, infection, and thyrotoxic storm

Parathyroidectomy
- indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum Ca++, marked hypercalciuria, Cr clearance <30% normal, bone density reduction with T score <2.5, <50 yr)
- contraindications: familial hypocalciuric hypercalcemia
- pre-operative workup: 99mTc sestamibi scanning, ± SPECT or CT, U/S
- complications: recurrent/superior laryngeal nerve injury, post-operative hypocalcemia, infection, and bleeding

Adrenal Gland

- see Endocrinology, E29
- functional anatomy
  - cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), and reticularis (sex steroids)
  - medulla: catecholamines (epinephrine, norepinephrine, normetanephrine)
- types of adrenal tumours: functional (e.g. Cushing's syndrome, Conn's syndrome) or non-functional

INCIDENTALOMA
- adrenal mass discovered by investigation of unrelated symptoms

Epidemiology
- benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
- metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, and kidney
- peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

Investigations
MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
- functional studies
  - pheochromocytoma: 24 h urine epinephrine, norepinephrine, metanephrine, normetanephrine, VMA (vanillylmandelic acid)
  - Cushing's: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
  - aldosteronoma: electrolytes, aldosterone:renin level, saline suppression test if appropriate
  - adrenal androgens: 17-OH progesterone, and DHEAS
- FNA biopsy: if suspect metastasis to adrenal (must exclude pheochromocytoma first to prevent a hypertensive crisis)
- indicated if history of cancer or patient is smoker
- iodocholesterol scintigraphy: may distinguish benign vs. malignant disease
Treatment
• functional tumour: resect
• non-functional tumour
  ■ >4 cm: resect
  ■ <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

## Pancreas

### INSULINOMA
- tumour that secretes insulin
- most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

#### Clinical Features
- Whipple's triad
  - palpitations, trembling, diaphoresis, confusion, seizure, and personality changes
- blood work: decreased serum glucose and increased serum insulin and C-peptide
- U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

#### Treatment
- only 10% are malignant
- enucleation of solitary insulinomas may be done endoscopically
  - tumours >2 cm located close to the pancreatic duct may require pancreatectomy or pancreaticoduodenectomy

### GASTRINOMA
- tumour secreting gastrin; cause of Zollinger-Ellison syndrome

#### Clinical Features
- abdominal pain, PUD, severe esophagitis
- multiple ulcers in atypical locations refractory of antacid therapy

#### Investigations
- blood work: serum gastrin levels (usually >1,000 pg/mL), secretin stimulation test
- U/S, CT: 70-90% found in Passaro's triangle (head of pancreas medially, 2nd portion of duodenum inferiorly, and the confluence of the cystic and CBD superiorly)
- octreotide scintigraphy scan

#### Treatment
- 50% are malignant
- surgical resection of tumour dependent on location
- non-surgical treatment: chemotherapy, somatostatin analogues, interferon, and chemoembolization
- if inoperable, vagotomy can be performed for symptomatic control

### VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOUR
- tumour secreting VIP; commonly located in the distal pancreas and most are malignant when diagnosed

#### Clinical Features
- severe watery diarrhea causing dehydration, weakness, and electrolyte imbalance

#### Investigations
- blood work: serum VIP levels
- U/S, CT

#### Treatment
- somatostatin analogues
- surgical resection/palliative debulking
### Pediatric Surgery

<tbody>
<tr>
<td><strong>Hydrocele (see Umbilical US)</strong></td>
<td>1%-2% of live births Present at birth, majority close spontaneously by 1 yr M:F = 6:1 Prematurity</td>
<td>Communicating hydrocele: processus vaginalis fails to close with small opening for fluid to move freely between peritoneal cavity through patent processus (if opening progresses to allow passage of intestine, it is a hernia) Noncommunicating hydrocele: fluid trapped in tunica vaginalis; in older children, may be secondary to testicular pathology (reactive hydrocele)</td>
<td>Painless scrotal mass Communicating hydroceles increase in size with standing or valsalva, may be absent in the morning and large in the evening Transillumination suggests hydrocele Silk glove sign: gently palpating hydrocele sac over pubic tubercle feels like rubbing silk on silk</td>
<td>US if suspect pathology</td>
<td>Most resolve spontaneously by 1 yr Surgical repair if: Persistence &gt;2 yr Pain Fluctuating in size which suggests communication Cosmetic reasons Infection</td>
<td>&lt;2% recurrence</td>
<td></td>
</tr>
<tr>
<td><strong>Hypertrophic Pyloric Stenosis</strong></td>
<td>0.03-1.0% of live births Can present at 1-20 wk, most commonly at 6-8 wk M:F = 4:1 Early erythromycin exposure (&lt;13 d old)</td>
<td>Acquired pyloric circular muscle hypertrophy results in gastric outlet obstruction</td>
<td>Hypovolemia caused by emesis of gastric contents causes hypochloremic, hypokalemic metabolic alkalosis Electrolyte exchange based volume retention in kidneys results in paradoxical aciduria</td>
<td>Electrolytes (assess hypokalemia, dehydration) U/S shows pyloric length &gt;14 mm, muscle thickness &gt;4 mm Upper GI series necessary only when U/S unavailable or non-diagnostic will show “string sign”</td>
<td>Fluid resuscitate with normal saline, correct electrolytes and acid/base abnormalities with DL, 1/2NS + 20 mEq/L KCl at maintenance rate NGT decompression unnecessary Pyelotomyomy open (Ranestadt vs. transumbilical or laparoscopic approach) Alternative therapies such as 1P/N/acet an impractical due to long time course of effect</td>
<td>Fluid resuscitate with normal saline, correct electrolytes and acid/base abnormalities with DL, 1/2NS + 20 mEq/L KCl at maintenance rate NGT decompression unnecessary Pyelotomyomy open (Ranestadt vs. transumbilical or laparoscopic approach) Alternative therapies such as 1P/N/acet an impractical due to long time course of effect</td>
<td>Fluid resuscitate with normal saline, correct electrolytes and acid/base abnormalities with DL, 1/2NS + 20 mEq/L KCl at maintenance rate NGT decompression unnecessary Pyelotomyomy open (Ranestadt vs. transumbilical or laparoscopic approach) Alternative therapies such as 1P/N/acet an impractical due to long time course of effect</td>
</tr>
<tr>
<td><strong>Congenital Diaphragmatic Hernia</strong></td>
<td>1 in 2,000 to 5,000 live births Present within hours of life although some cases of delayed presentation N=1 F &gt;10% are associated with other congenital anomalies Prenatal diagnosis common</td>
<td>Left-sided: small bowel, large bowel stomach, and solid viscera (spine, left lobe of liver) herniate into thorax Right-sided: liver, large bowel herniating into thorax Pulmonary hypoplasia Pulmonary HTN</td>
<td>Early respiratory distress Cyanosis Scaphoid abdomen Prenatal diagnosis</td>
<td>Decreased air entry ± bowel sounds in the chest Displaced heart sounds Prenatal US/MRI ABG CXR (bowel loops in hemithorax, shifted heart) Echocardiography Genetic consultation if warranted</td>
<td>Intubate</td>
<td>Better outcomes in later presentations Haring defect (40%) Associated GERD MSK defects – chest wall and scoliotic defects a potential complication of thoracotomy Long-term surveillance for potential recurrence Failure to thrive Chronic lung disease if severe hypoplasia</td>
<td>Better outcomes in later presentations Haring defect (40%) Associated GERD MSK defects – chest wall and scoliotic defects a potential complication of thoracotomy Long-term surveillance for potential recurrence Failure to thrive Chronic lung disease if severe hypoplasia</td>
</tr>
<tr>
<td><strong>Meckel’s Diverticulum</strong></td>
<td>1% of population M:F = 3:1 Present most frequently during first 5 yr of life Symptomatic in 2% of cases</td>
<td>Failure of vitreous duct to regress 5-7 wk i utero; 50% can an heterotopic tissue (e.g. gastric mucosa, ectopic pancreas) other associated anomalies include omphalocelemenent fistula, umbilical sinus, umbilical cyst, fibrous band</td>
<td>BRRPR (heterotopic gastric mucosa in Meckel’s causing mucosal ulceration and bleeding in adjacent small bowel mucosa) Abdominal sepsis (Meckel’s diverticulitis + perforation) Small bowel volvulus around fibrous band</td>
<td>AXR Meckel scan: scan for ectopic gastric mucosa with technetium Tc99m pertechnetate IV (sensitivity 65%, specificity 90%)</td>
<td>Stabilize, ressect by laparotomy or laparoscopy ± incidental appendectomy</td>
<td>Resection curative</td>
<td>Stabilize, ressect by laparotomy or laparoscopy ± incidental appendectomy</td>

<td>-----------</td>
</tr>
<tr>
<td><strong>Intestinal Atresia</strong></td>
<td>Incidence 2-14% May be antenatally diagnosed by dilated bowel loops or &quot;double-bubble&quot; sign on x-ray for duodenal atresia Decreased with increasing age</td>
<td>Failure of gut to normally rotate around SMA with associated abnormal intestinal attachments and anatomic positions Represent a spectrum of rotational abnormalities including complete non-rotation (which is not at high risk for volvulus)</td>
<td>Bilious emesis = THE cardinal sign, especially if abdomen non-distended If bilious enteritis in ill child with distended abdomen, consider surgical exploration to rule out volvulus Rectal bleed (late/onset signs)</td>
<td>AXR: obstruction of proximal SBO, double-bubble sign, intestinal wall thickened Immediate UGI: duodenal/dysmotional segment (Lipament of Treitz) right of midline and not fixed posteriorly over spinal column, &quot;corkscrew&quot; sign indicating volvulus US: &quot;whirlpool&quot; sign, abnormal SMA-SVV relationship indicates UGI to rule out rotational anomalies</td>
<td>IV antibiotics Fluid resuscitation ENERGENT LAPAROTOMY Ladd procedure: counterclockwise reduction of midgut volvulus, division of Ladd's bands, division of parietal attachments between cecum and abdominal wall that obstruct duodenum, broadening of the mesentery (open folded mesentery like a book and divide concomitant adhesions), ± appendectomy Positioning the bowel into non-rotation (SBO in right abdomen, LBO in left abdomen)</td>
<td>Mortality related to length of bowel loss: 10% necrosis – 100% survival rate, 75% necrosis – 90% survival rate Recurrence 2-6%</td>
<td></td>
</tr>
<tr>
<td><strong>Gastric d stension and vomiting (usually bilious)</strong></td>
<td>Duodenal – may be associated with other anomalies (tracheoesophageal fistula, cardiac, renal, and vertebral anomalies), 24-28% have Down syndrome Jejunal/ileal – within 2 d of birth, may be associated with CF Colonc – within 3 d of birth</td>
<td>Complete physical examination. Special attention to abdominal examination. Peristalsis and anus include evaluation of respiratory distress and signs of volume depletion Congenital anomalies Jaundice</td>
<td>Contrast enema ± USI with small bowel lube through (SBFT) Group and screen INR and PTT if for surgery</td>
<td>NPO NGT decompression Flud resuscitate TPN Broad spectrum antibiotics Duodenal – duodenodudenoenterostomy or duodenojejunostomy Jejunal/ileal – primary anastomosis, if atresia associated with short bowel then may create and stoma or defer surgery for bowel lengthening procedures Colonc – primary anastomosis</td>
<td>Long-term survival Duodenal – 86% Jejunal/ileal – 64% Colonc – 100%</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Umbilical Hernia</strong></td>
<td>Incidence 2-14% Increases with premenatal Decreases with increasing age</td>
<td>Incomplete closure of peritoneal and fascial layers within umbilicus by 4 yr Hernia is peritoneum-lined and skin-covered Size of fascial defect determines chances of spontaneous closure</td>
<td>Majority asymptomatic Majority (95%) spontaneously resolve by age 4 Incarceration prior to age 5 very rare Most symptoms occur in late adequence or adulthood</td>
<td>None if uncomplicated Repair if not spontaneously closed by age 5 Earlier repair of large &quot;proboscoid&quot; hernias with extensive skin stretching may be warranted for cosmetic reasons Simple primary closure of fascial defect</td>
<td>Repair if not spontaneously closed by age 5 Earlier repair of large &quot;proboscoid&quot; hernias with extensive skin stretching may be warranted for cosmetic reasons Simple primary closure of fascial defect</td>
<td>Almost never become incarcerated Low risk of recurrence</td>
<td></td>
</tr>
<tr>
<td><strong>Gastrochisis</strong></td>
<td>1:2,000 live births Antenatal diagnosis common Increases with younger maternal age and associated with IUGR MF = 1:1</td>
<td>Defect of abdominal wall, with free extrusion of intestine into amniotic cavity No specific environmental factor identified Defect in embryogenesis unclear</td>
<td>Associated with genetic syndromes 10% with intestinal atresia Some cases associated with short bowel syndrome due to antenatal volvulus and necrosis of herniated bowel</td>
<td>Prenatal US Elevated MS-AFP</td>
<td>NGT decompression IV fluids IV antibiotics Keep viscera moist and protected until surgical reduction with primary abdominal closure or staged closure with abs May have bowel dysfunction requiring motility medications</td>
<td>&gt;80% survival rate</td>
<td></td>
</tr>
<tr>
<td><strong>Omphalocele</strong></td>
<td>1:5,000 live births Antenatal diagnosis common Lower gestational age Increased maternal age MF = 1:5:1</td>
<td>Defect of abdominal wall and umbilical ring, with extrusion of sac-covered viscera (amnion, Wharton's jelly, peritoneum) Balbim's theory – failure of body wall morphogenesis Commonly associated with rotational abnormalities of the intestine</td>
<td>Associated with genetic syndromes 30-70% (e.g. Pentalogy of Cantrell congential heart disease, BeckwithWiedemann syndrome, Trisomy 18) Associated pulmonary hypoplasia a</td>
<td>Prenatal US Elevated MS-AFP</td>
<td>NGT decompression IV fluids, IV antibiotics Small defect (&lt;2 cm): Primary closure Medium (2-4 cm) and large (&gt;4 cm) defects: silver sulfadiazine coupled with compression dressing (to allow epithelialization and gradual reduction) or Sit-On Sim Pouch, followed by future repair ± mesh</td>
<td>40-10% survival rate Higher survival rates most likely related to antenatal mortality of fetuses with giant omphaloceles</td>
<td></td>
</tr>
<tr>

<tr>
<td>------------------------------</td>
<td>-------------------------------</td>
<td>-----------------</td>
<td>-------------------------------</td>
<td>---------------</td>
<td>---------------</td>
<td>-----------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td><strong>Hirschsprung’s Disease</strong></td>
<td>1:50,000 births M:F = 3:1 to 4:1, approaches 1:1 when male tocol corresponds, has have some genes of small bowel as well Familial Hirschsprung’s in &lt; 5% of cases</td>
<td>Defect in migration of neurocrest cells to interstitio resulting in aganglionic bowel that fails to relax and internal sphincter that fails to relax (internal anal sphincter achalasia) causing functional and partial mechanical obstruction, respectively; always starts in the rectum and variable involvement proximally; RET mutation</td>
<td>Failure to pass meconium spontaneously within 48 h of life is the classic history (95% pass meconium within 24h, 5% within 48h) Symptoms of bowel obstruction: abdominal distension, constipation, bulitus emesis Enterocolitis/sepsis Failure to thrive</td>
<td>Rectal biopsy (gold standard) – look for aganglionosis and neural hypertrophy</td>
<td>AXR</td>
<td>Duhamel pull-through procedure: surgical resection of aganglionic intestinal segment and anastomosis of remaining intestine to anus Either in newborn period or staged if extensive aganglionosis</td>
<td>Most have normal/ near-normal anorectal function Complications: Fecal incontinence and constipation, post operative enterocolitis (medical emergency if progresses to sepsis)</td>
</tr>
<tr>
<td><strong>Cryptorchidism</strong></td>
<td>2-5% of term males – most of these descend spontaneously by 6 mo of age 1% of males do not spontaneously descend Suspect in prematurity</td>
<td>Idiopathic Descent is mediated by desman which is created in response to testosteron. Descent usually begins at 28 wk</td>
<td>Palpable testicle within inguinal canal or testicle which can be milled down into scrotum (called retrac testis) Occasionally no palpable testis as it is intra-abdominal Consider other congenital abnormalities</td>
<td>Scoliosis asymmetry Bi-annual testicular exam with palpation Distinction truly undescended testes from retractile testis (which is &quot;high&quot; testis due to hyperactive cremasteric muscles)</td>
<td>Depends on age of presentation Older child LH, FSH, MIS, hCG stimulation test for gonadotropin production Infant: US FSH, LH, karyotype, MIS, 17 hydroxy-progesterone If non-palpable: Exam under anesthesia, exploratory laparoscopy</td>
<td>hCG to stimulate testosterone production and descent Orchidopexy – especially if undescended by age 6 mo-2 yr</td>
<td>Orchidopexy Decreased risk of torsion and blunt trauma to testicle No effect on malignant potential of testis Descant can preserve spermatogenesis if performed by 1 yr of age</td>
</tr>
<tr>
<td><strong>Intussusception</strong></td>
<td>Most common cause of bowel obstruction between 6-36 mo 26:100,000 newborns M:F = 3:2 Pathologic lead points: e.g. Meckel’s diverticulum CF, lymphoma, BDI may increase risk</td>
<td>Idiopathic is most common Usually starts at ileocecal junction Telescoping of bowel itself causing an obstruction and vascular compromise</td>
<td>Acute onset of abdominal pain which is classic episodic &quot;colicky&quot; pain Vomiting = bilious Abdominal pain Current-jelly stool suggests mucosal necrosis and straining</td>
<td>Abdominal exam Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness Signs of bowel obstruction: distended abdomen Look for localized peritonitis which suggests transmural ischemia</td>
<td>AXR for signs of bowel obstruction or perforation US if suspect pathology</td>
<td>If perforation, then consider operative management Non-operative management involves reduct or via air contrast enema Operative reduction can be done open or laparoscopically Resection of involved colon if failure to reduce or bowel appears compromised</td>
<td>If recurrent = more likely non-idiopathic If successfully reduced by enema in older age allow 2wk resolution of edema then perform SBFT to rule out pathologic lead points</td>
</tr>
<tr>
<td><strong>Tracheoesophageal Fistula (TEF)</strong></td>
<td>1:3,000-1,500 newborns Associated anomalies in 50%: VACTERL association</td>
<td>Fistulae vary with type of fistulae May have history of maternal polyhydramnios May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning</td>
<td>X-ray: anatomic abnormalities, NGT curled in pouch</td>
<td>X-ray: anatomic abnormalities, NGT curled in pouch</td>
<td>Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth</td>
<td>Complications: pneumonia, sepsis, reactive airways disease Following repair: esophageal stenosis and stricture at repair site, GERD and poor swallowing (i.e. dysphagia, reguritation)</td>
<td></td>
</tr>
<tr>
<td><strong>Inguinal Hernias</strong></td>
<td>5% of all term newborns 2x risk and more likely bilateral if pre-term M:F = 4:1 Low birth weight increases risk 1/5 inguinal hernias will become incarcerated if patient is &lt; 1yr old Incarceration is more common in females Associated with other conditions: androgen insensitivity, connective tissue diseases</td>
<td>All infant hernias are indirect: descent of intra-abdominal contents through the internal inguinal ring through a patent tuberculum Morgue LInguinal hernia can be reducible, incarcerated (irreducible) or strangulated</td>
<td>Most common presentation: painless intermittent mass in groin may also note extension into scrotum (scrotum mass in absence of inguinal mass is a hydrocele) If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted</td>
<td>Palpate for “bag of worms” suggests possible texticular varicocele Biannual testicular exam + palpation along inguinal canal to evaluate for any masses &quot;Silk sign&quot; – palpable thickening of cord Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen Must always try reduction to confirm that hernia is not incarcerated</td>
<td>Physical exam is gold standard US only if physical exam uncertain (e.g. in small infants where exam can be difficult)</td>
<td>Manual reduction – (in the DR) to relieve acute symptoms (then repair) For reducible hernia repair within a few weeks (if &lt; 1 yr vs. elective repair if &gt; 1 yr) For incarcerated hernia: repair immediately (emergency) Hemorrhage – definitive treatment by reduction of herniated contents and high ligation of ssc for indirect hernias Laparoscopic or open techniques</td>
<td>Risk of recurrence after surgical reduction &lt; 3% but higher if repair done in premature infants or if hernia was incarcerated/ strangulated at repair</td>
</tr>

</table>
Skin Lesions

• see Dermatology, D5; Emergency Medicine, ER43; Plastic Surgery, PL5

Common Medications

Antiemetics
• dimenhydrinate (Gravol®) 25-50 mg PO/IV/IM q4-6h
• prochlorperazine (Stemetil®) 5-10 mg PO/IV/IM bid-tid
• metoclopramide (Maxeran®) 10 mg IV/IM q2-3h pm, 10-15 mg PO qid (30 min before meals and qhs)
• ondansetron (Zofran®) 4-8 mg PO qid
• granisetron (Kytril®) 1 mg PO bid (for nausea from chemotherapy/radiation)

Analgesics
• acetaminophen ± codeine (Tylenol® #3/plain) 1-2 tabs q4-6h PO/PR pm
• hydromorphone i-i tabs PO q4-6h pm, 0.5-2 mg IV q4-6h pm
• ibuprofen 200-400 mg PO q4-6h pm
• morphine 2.5-10 mg IM/SC q4-6h pm + 1-2 mg IV q1h pm for breakthrough
• ketorolac (Toradol®) 30-60 mg IM/IV q6h pm
• Percocet® (acetaminophen/oxycodeone, 325/5 mg) 1-2 tabs PO q4-6h pm

DVT Prophylaxis
• heparin 5,000 units SC bid, if cancer patient then heparin 5,000 units SC tid
• dalteparin (Fragmin®) 5,000 units SC daily
• enoxaparin (Lovenox®) 40 mg SC daily

Antidiarrheals
• loperamide (Imodium®) 4 mg PO bid after each loose stool up to 16 mg/d
• diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PD qid

Laxatives
• sennosides (Senokot®) 1-2 tabs qhs
• docusate sodium (Colace®) 100 mg PO bid
• glycerine suppository 1 tab PR pm
• lactulose 15-30 mL PO qid
• milk of magnesia (MOM) 30-60 mL PO qid
• bisacodyl (Dulcolax®) 10-15 mg PO qd

Sedatives
• zopiclone (Imovane®) 5-7.5 mg PO qhs
• lorazepam (Ativan®) 0.5-2 mg PO/SI q3q4h

Antibiotics
• cefazolin (Ancef®) 1 g/IM on call to OR or q8h – GP except Enterococcus, GN only E. coli, Klebsiella, and Proteus
• cefalexin (Keflex®) 250-500 mg PO qid – Listeria, GP except Enterococcus and E. coli, Klebsiella, and Proteus
• ceftaxone 1-2 g IM/IV q24h – broad coverage including Pseudomonas
• ampicillin 1-2 g IV q4-6h – Listeria, GP (Enterococcus except Strep, stachylococcus and E. coli, oral anaerobes except Bacteroides
• gentamicin 3.5 mg/kg/d IM/IV divided q8h; monitor creatinine, gentamicin levels – GN including Pseudomonas
• ciprofloxacin 400 mg IV q12h, 500 mg PO bid – GN including Pseudomonas
• metronidazole (Flagyl®) 500 mg PO bid (500 mg PO tid for C. difficile) – anaerobes
• clindamycin 600-900 mg IV q8h, 150-400 mg PO qd – GP except Enterococcus, anaerobes
• piperacillin/tazobactam 4.5 mg q6h – GP, GN, and anaerobes
• vancomycin 1g IV q12h – GP and MRSA
• sulfamethoxazole/trimethoprim DS (Septra®) PO bid – GP, GN including Nocardia

Over-the-Counter Medications
• Pepto-Bismol® (bismuth subsalicylate) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d
• Alka-Seltzer® (ASA + citrate + bicarbonate) 2 tabs or 4 oz water PO q4h pm, max 8 tabs
• Maalox® (aluminum hydroxide + magnesium hydroxide) 10-20 mL or 1-4 tabs PO pm
• Tums® (calcium carbonate) 1-3 g PO q4h
• Rolaids® (calcium carbonate and magnesium hydroxide) 2-4 tabs PO q1h pm, max 12 tabs/d

Acronyms

Definition

- Major categories of impairment that appear with old age and affect the physical, mental, and social domains of the elderly, usually due to many predisposing and precipitating factors, rather than a single cause.

Table 1. Changes Occurring Frequently with Aging

Differential Diagnoses of Common Presentations

Frailty (Function Decline/Failure to Thrive)

Definition

- Frailty: clinical state of older adults with increased vulnerability to acute stressors resulting from functional decline.
- Functional decline: progressive limitation in the ability to carry out basic functional activities.
- Failure to thrive: a state of decline that may be characterized by weight loss, decreased appetite, poor nutrition, and inactivity.

Four Syndromes in Failure to Thrive

- My Pa Can’t Drive
- Malnutrition
- Physical impairment
- Cognitive impairment
- Depression
**Etiology**
- multifactorial - malnutrition, functional impairment, cognitive impairment, and depression

<table>

**Indicators**
- Depression
- Malnutrition
- Cognitive impairment
- Functional impairment (decreased mobility)

**Investigations**
- Limited laboratory tests and radiologic survey
- MMSE, ADL, and IADL scales
- “Up and Go Test”
- Geriatric Depression Scale
- Nutritional assessment
- Medication review
- Chronic disease evaluation
- Environmental assessment

**Failure to Thrive**

**Depression**
- Psychotherapy
- Antidepressants
- Modify environment

**Malnutrition**
- Speech therapy evaluation
- Treat oral pathology
- Increase frequency of feedings
- Nutritional supplements

**Cognitive Impairment**
- Optimize living conditions
- Treat depression
- Treat malnutrition
- Treat infection
- Administer dementia-delaying medications

**Functional Impairment**
- Physical therapy
- Occupational therapy
- Modify environment

**If response is positive, continue to treat**

**If no or minimal response, conduct conference with patient, patient’s family, and caregivers**

**Repeat evaluations, if appropriate**

**Consider discussion of end-of-life and hospice options**

*A positive response is defined as achievement of ≤t pretreatment goals, as determined by the patient, the patient’s family, and participating caregivers.*

**Figure 1. Failure to thrive in elderly patients**
Adapted from: *American Family Physician* 2004;70: 343-350
**Delirium, Dementia, and Depression**

- see Psychiatry, PS19, PS20, PS10 and Neurology, N20

**Definition**
all of the above may present with pathologic decrease in memory, language, or executive function

**Differential Diagnosis**
- delirium, dementia, or pseudodementia of depression (see Psychiatry)

**Delirium Prevention in Elderly**
- ensure optimal vision and hearing to support orientation (e.g. appropriate eye wear and hearing aids)
- provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- encourage regular mobilization to build and maintain strength, balance, and endurance
- avoid unnecessary medications and monitor for drug interactions
- avoid bladder catheterization if possible
- ensure adequate sleep

</table>

**Falls**

**Definition**
an event which results in a person coming to rest inadvertently on the ground or floor or other lower level

**Epidemiology**
- 30–40% of people >65 yr old and ~50% of people >80 yr old fall each year
- equally common between men and women, but more likely to result in injury in women and death in men
- falls are the leading cause of death from injury in persons ≥65 yr
- 25% associated with serious injuries (e.g. hip fracture, head injury, bruises, laceration)
- between 25-75% do not recover to previous level of ADL function

**Etiology**
intrinsic factors
- age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)
- orthostatic/syncopal
- side effects of medications and substance abuse  e.g alcohol
- acute illness, exacerbation of chronic illness

**Antipsychotics for Delirium**
**Cochrane DB Syst Rev 2009;CD005594**

**Objectives:** To compare the efficacy and incidence of adverse effects of haloperidol with risperidone, olanzapine, and placebo in the management of delirium and in the incidence of adverse drug reactions. Decreases in delirium scores were not significantly different when comparing the effect of low dose haloperidol (<3.0 mg/d) with olanzapine and risperidone (odds ratio 0.63; 95% CI 10.29-1.38; p=0.23). High dose haloperidol (>4.5 mg/d) was associated with an increased incidence of extrapyramidal adverse effects compared with olanzapine. Low dose haloperidol decreased the severity and duration of delirium in post-op native patients, although not the incidence of delirium compared to placebo.

**Selection Criteria:** Types of studies included, unconfounded, randomized trials with concealed allocation of subjects.

**Results:** Three studies were included, comparing haloperidol with risperidone, olanzapine, and placebo in the management of delirium. A meta-analysis of the studies showed that haloperidol decreased the severity and duration of delirium in post-operative patients, although not the incidence of delirium compared to placebo.

**Conclusions:** There is no evidence that haloperidol in low dosage has different efficacy in comparison with the atypical antipsychotics olanzapine and risperidone in the management of delirium or has a greater frequency of adverse drug effects than these drugs. High dose haloperidol was associated with a greater incidence of side effects. Low dose haloperidol may be effective in decreasing the degree and duration of delirium in post-operative patients, compared with placebo. However, all studies were small and should be repeated.

**Key Physical Findings in the Elderly Patient**
**Who Falls or Nearly Falls**

**I HATE FALLING**
Inflammation of joints
Hypotension (orthostatic changes)
Auditory and visual abnormalities
Tremor
Equilibrium (balance) problem
Foot Problems
Arrhythmia, heart block or valvular disease
Leg-length discrepancy
Lack of conditioning (generalized weakness)
Illness
Nutrition
Gait disturbance
Am Fam Phys 2001;61:2159-2172
extrinsic factors
- environmental (e.g. home layout, slippery surfaces, overcrowding, new environments)
- situational factors
  - activities (e.g. rushing to the toilet, walking while distracted)

**History and Physical Exam**
- history: previous falls and/or gait inability, inquire about intrinsic, extrinsic and situational factors, associated symptoms, loss of consciousness, medication and alcohol use
- have a witness present if possible for interview
- physical exam: Orthostatic blood pressure, visual acuity, examination of feet and footwear, Performance-Oriented Assessment of Mobility, Timed Up-And-Go Test

**Investigations**
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose, Ca++, TSH, B12, urinalysis, cardiac enzymes, ECG, CT head (as directed by history and physical)

**Prevention**
- multidisciplinary, multifactorial, health, and environmental risk factor assessment and intervention programs in the community
- muscle strengthening, balance retraining, and group exercise programs (e.g. Tai Chi)
- home hazard assessment and modification (e.g. remove loose rugs and tripping hazards, add shower bars and stair railing, improve lighting)
- prescription of vitamin D 1000 IU daily
- tapering or gradually discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight and footwear optimization
- support hose for varicose veins and ankle swelling
- connect patient to lifeline button signaling system

**Figure 2. Approach to falls in the elderly**

Adapted from: Davidson S, Dhammar jan TS. Clinical Geriatrics 2013;21(10)
Osteoporosis
- see Endocrinology, E40

Gait Disorders
- see Neurology, N10

Hypertension
- see Family Medicine, FM34

Definition
- blood pressure at which an otherwise healthy person would have increased risk of cardiovascular disease
- definition of high blood pressure has changed over time and differs between guidelines proposed by expert bodies

Epidemiology
- 60-80% of elderly (>65 yr) have HTN
- 60% of these have isolated systolic HTN
- the benefit of treating HTN in the elderly is 2-4 times greater than that achieved in the treatment of younger patients with primary HTN
- sBP and pulse pressure are major predictors of outcome in the elderly patient
- in older adults, base treatment on sBP

Management
- targets
  - <140/90 mmHg for adults ≤80 yr
  - <130/80 mmHg for individuals with DM or CKD
  - <150 sBP for adults aged 80 or older
- for patients ≥60 yr, initiate pharmacological therapy when BP ≥150/90mmHg
- if there is comorbid DM, initiate pharmacological therapy when BP ≥140/90mmHg
- 1. non-pharmacologic treatments; 2. thiazide or thiazide-like diuretic monotherapy are first line pharmacological treatments in patients without comorbidities; 3. second line treatments depend on comorbidities
- add ACEI/ARB if also atherosclerosis, DM, CHF or CKD
- add β-blockers if also angina or CHF

Malnutrition

Definition
- involuntary weight loss (community: ≥2% over 1 mo, >10 lbs over 6 mo or ≥4% over 1 yr; nursing home: ≥5% over 1 mo, ≥10% over 180 d)
- hypoalbuminemia, hypocholesterolemia
- other features include: insufficient energy intake, loss of muscle mass, fluid accumulation (e.g. edema), loss of subcutaneous fat, decreased hand-grip function

Etiology
- nutritional
  - decreased assimilation: impaired transit, maldigestion, malabsorption
  - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)
  - stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
  - mechanical: dental problems, dysphagia
  - age-related changes: appetite dysregulation, decreased thirst
  - mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

Clinical Features
- history
  - recent or chronic illness
  - depression, GI symptoms
  - functional disability: impaired ADLs and IADLs
  - social factors: economic barriers, dental problems and living situation (e.g. living alone)
  - constitutional symptoms (e.g. recent weight loss)
• physical exam
  - BMI <23.5 in males, <22 in females should raise concern
  - temporal wasting, muscle wasting, presence of triceps skin fold
  - assess cognition

Investigations
- CBC, electrolytes, Ca\(^{2+}\), Mg\(^{2+}\), PO\(_4^{3-}\), creatinine, LFTs (albumin, INR, bilirubin), B12, folate, TSH, transferrin, lipid profile, urinalysis, ESR, CXR

Treatment
- direct treatment at underlying causes
- dietary modification: high calorie foods, oral nutritional supplementation; patient specific meal replacement products (e.g. Ensure\(^{TM}\), Glucerna\(^{TM}\), Nepro\(^{TM}\)), food/drink thickeners (e.g. Thicken-Up\(^{TM}\)), vitamins/minerals (e.g. B12, calcium, vitamin D)
- referral: speech language pathologist, nutritionist

Constipation
- see Gastroenterology, G24

Definition
- <3 bowel movements in one wk and/or hard stools, straining, sense of blockade, needing manual maneuvers or incomplete evacuation on more than 25% of occasions for at least 12 wk (does not need to be consecutive). Symptoms must have occurred in the last 3 mo, with symptom onset ≥6 mo before diagnosis can be made

Epidemiology
- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation and 1/2 of patients >80 yr)
- in the elderly, chronic constipation may present as fecal impaction

Pathophysiology
- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

Figure 3. Treatment algorithm for the management of chronic constipation in the elderly
Adapted from: Clin Interv Aging 20 0;5: 63-171

Calculating Basic Caloric and Fluid Requirements
WHO daily energy estimates for adults
- Male: 13.5 x (weight in kg) + 487
- Female: 10.5 x (weight in kg) + 596

Maintenance fluid requirements for the elderly without cardiac or renal disease: 1500-2500 cc/24 h

Common Causes of Constipation in the Geriatric Population include:
- GI (colon cancer, diverticulosis)
- Neurologic (stroke dementia, Parkinson’s)
- Psychiatric (depression, anxiety)
- Drugs (see below)
- Diet (dehydration, “tea and toast” diet)

Drugs Associated with Constipation include:
- OTC (antihistamines, NSAIDs)
- Opioids
- Psychotropic (antipsychotics, TCAs)
- Anticholinergics
- Calcium channel blockers
- Diuretics
- Supplements (iron or calcium)

Treatment of Constipation in Older Adults CMAJ 2013;185(8):663-70
Objectives: To discuss management of constipation in older adults.
Results/Conclusions: In older adults, the predominant symptom of constipation is more frequently straining than decreased stool frequency. MCTs support the use of osmotic agents to treat symptoms of constipation in older adults. In contrast evidence supporting the use of bulk agents, stool softeners stimulants and prokinetic agents is lacking, limited and inconsistent.

Figure 3. Treatment algorithm for the management of chronic constipation in the elderly
Adapted from: Clin Interv Aging 20 0;5: 63-171
Treatment
- non-pharmacological
  - increase fibre intake
  - ensure adequate fluid intake
- pharmacological
  - discourage chronic laxative use
  - review medication regime, reduce dosages or substitute

see Common Medications, GM11

Incontinence

Fecal Incontinence

Definition
- involuntary passage or the inability to control the discharge of fecal matter through the rectum
- severity can range from unintentional flatus to the complete evacuation of bowel contents
- there are three subtypes:
  1. passive incontinence: involuntary discharge of stool or gas without awareness
  2. urge incontinence: discharge of fecal matter in spite of active attempts to retain bowel contents
  3. fecal: leakage of stool following otherwise normal evacuation

Epidemiology
- age is independently associated with fecal incontinence
- the incidence of fecal incontinence differs by setting: community (17-36%), hospital (16%) and nursing home (33-65%)

Etiology
- physiological changes with age >80 yr (e.g. decreased external sphincter strength, decreased resting tone of internal sphincter, weakened anal squeeze, increased rectal compliance, and impaired anal sensation)
- trauma (e.g. vaginal delivery, pudendal nerve damage, cauda equina)
- iatrogenic
  - surgical (e.g. anal resection, hemorrhoidectomy, colorectal resection)
  - radiation (e.g. pelvic radiation)
- neurogenic (e.g. neuropathy, stroke, MS, diabetic neuropathy)
- anorectal/colorectal diseases (e.g. rectal prolapse, hemorrhoids, IBD, rectocele, cancer)
- medication (e.g. laxative, anticholinergics, antidepressants, caffeine, muscle relaxants)
- cognitive (e.g. dementia, willful soiling with psychosis)
- constipation/fecal impaction

Investigations (if cause not apparent from history and physical)
- differentiate true incontinence from frequency and urgency (e.g. IBS, IBD)
- stool studies
- endorectal ultrasound
- colonoscopy, sigmoidoscopy, anoscopy
- anorectal manometry/functional testing

Management
- physiological changes with age: medication management (anti-motility agents (e.g. loperamide), diet/bulking agents for loose stool) increase fluid intake, biofeedback, retraining of pelvic floor muscles, surgery
- trauma: direct surgical repair or augmentation of the sphincters
- iatrogenic: surgical repair, artificial sphincters
- neurogenic: medication management, abdominal massage, digital stimulation for dysfunction, biofeedback and behavioural training, prevent autonomic dysreflexia in spinal injury
- anorectal/colorectal diseases: treat underlying cause (optimize IBD medications), surgical (e.g. mass removal, prolapse repair, hemorrhoid removal, colostomy)
- medication-related causes: stop laxatives, lower dose or discontinue any other offending agents
- cognitive: regular defecation program in patients with dementia, psychiatric consult (optimize medications and cognitive function)
- constipation/fecal impaction: disimpaction, prevent impaction, enema or rectal irrigation

Urinary Incontinence
- see Urology, U5

Definition
- complaint of any involuntary loss of urine
- can be further classified according to patients symptoms as urgency urinary incontinence, stress urinary incontinence, mixed urinary incontinence, nocturnal enuresis, post-micturition dribble, and continuous urinary leakage
**Epidemiology**
- 15-30% prevalence dwelling in community and at least 50% of institutionalized seniors
- morbidly: cellulitis, pressure ulcers, urinary tract infections, falls with fractures, sleep deprivation, social withdrawal, depression, sexual dysfunction
- not associated with increased mortality

**Pathophysiology**
- not a normal part of aging, urinary incontinence is a loss of control due to a combination of:
  - genitourinary pathology: increased post void residual volume, increased involuntary bladder contractions (urge incontinence)
  - age-related changes: decreased bladder capacity
  - comorbid conditions and medications
  - functional impairment
  - in elderly women: decline n bladder outlet and urethral resistance pressure promoting stress incontinence
  - in elderly men: prostatic enlargement can cause overflow and urge incontinence

**Immobility**
- cardiovascular: orthostatic hypotension, venous thrombosis, embolism
- respiratory: decreased ventilation, atelectasis, pneumonia
- gastrointestinal: anorexia, constipation, incontinence, dehydration, malnutrition
- genitourinary: infection, urinary retention, bladder calculi, incontinence
- musculoskeletal: atrophy, contractures, bone loss
- skin: pressure ulcers
- psychological: sensory deprivation, delirium, depression

**Pressure Ulcers**
- see Plastic Surgery, PL17

**Risk Factors**
- extrinsic factors: friction, pressure, shear force
- intrinsic factors: immobility, malnutrition, moisture, sensory loss
- geriatric specific factors: age related skin changes, bed-bound, cognitive impairment, chronic illness, use of antihypertensive medications

**Table 4. Classification of Pressure Ulcers**

<table>
<thead>
<tr>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage I</td>
<td>Changes include skin temperature, tissue consistency or sensation. An area of persistent erythema in lightly pigmented, intact skin; in darker skin, it may appear red, blue or purple.</td>
</tr>
<tr>
<td>Stage II</td>
<td>Partial thickness skin loss involving the epidermis, dermis or both. The ulcer is superficial and presents as an abrasion, blister or shallow crater.</td>
</tr>
<tr>
<td>Stage III</td>
<td>Full thickness skin loss involving damage or necrosis of subcutaneous tissue which may extend down to, but not through, underlying fascia. Presents as a deep crater with or without undermining of adjacent tissue.</td>
</tr>
<tr>
<td>Stage IV</td>
<td>Full thickness skin loss with extensive destruction, tissue necrosis or damage to muscle, bone or supporting structures. May have associated undermining and/or sinus tracts.</td>
</tr>
</tbody>
</table>

**Prevention**
- pressure reduction
- frequent repositioning
- pressure-reducing devices (static, dynamic)
- maintaining nutrition, encouraging mobility and managing incontinence

**Treatment**
- optimize nutritional status
- minimize pressure on wound
- analgesia
- all ulcers with necrosis warrant debridement (mechanical, enzymatic and autolytic are non-urgent forms of debridement whereas, sharp debridement is performed urgently due to risk for sepsis or cellulitis)
- dressing application (exudate absorbing, barrier products to reduce friction)
- diabetic foot ulcers: offloading with removable cast walker (e.g. aircast boot), orthopedic shoes and orthotics
- maintain moist wound environment to enable re-epithelialization
• treatment of wound infections (topical gentamicin, silver sulfadiazine, mupirocin)
• swab wounds not demonstrating clinical improvement for C&S; biopsy chronic wounds to rule out malignancy
• referral to Wound Care
• consider other treatment options
  ▪ negative pressure wound therapy/vacuum-assisted closure
  ▪ biological agents: application of fibroblast growth factor, platelet-derived growth factor to wound
  ▪ non-contact normothermic wound therapy
  ▪ electrotherapy

### Hazards of Hospitalization

| Table 5. Recommendations for Sequelae of Hospitalization in Older Patients |
|-----------------------------|----------------------------------------------------------------------------------------------------------|
| **Sequelae**                | **Recommendations**                                                                                     |
| Malnutrition                | No dietary restrictions (except diabetes), assistance, dentures if necessary, sitting in a chair to eat   |
| Urinary Incontinence        | Medication review, remove environmental barriers, discontinue use of catheter                           |
| Depression                  | Routine screening                                                                                        |
| Adverse Drug Event          | Medication review                                                                                        |
| Confusion/Delirium          | Orientation, visual and hearing aids, volume repletion, noise reduction, early mobilization, medication review, remove restraints |
| Pressure Ulcers             | Low-resistance mattress, daily inspection, repositioning every 2 h                                       |
| Infection                   | Early mobilization, remove unnecessary IV lines, catheters, NG tubes                                     |
| Falls                       | Appropriate footwear, assistive devices, early mobilization, remove restraints, medication review          |
| Hypotension/Dehydration      | Early recognition and repletion (ideally oral rehydration, if possible)                                   |
| Diminished Aerobic Capacity/Loss of Muscle Strength/Contractures | Early mobilization                                                                                     |
| Decreased respiratory function | Incentive spirometry, physiotherapy                                                                     |
| Functional decline          | Structured exercise, progressive resistance training, walking programs                                   |

### Elder Abuse

**Definition**
• includes physical abuse, sexual abuse, emotional/psychological abuse, financial abuse, abandonment, institutional abuse and neglect
• elder abuse is a criminal offence under the Criminal Code of Canada
• in the U.S., most states have criminal penalties for elder abuse

**Epidemiology**
• in Canada in 2013, almost 3000 seniors were victims of family violence. The perpetrators of family violence against seniors were identified to be their grown child (43% of cases) and their spouses (28% of the cases)
• in the U.S., estimates of the frequency of elder abuse range from 3-8%
• insufficient evidence to include/exclude screening in the Periodic Health Exam

**Risk Factors**

<table>
<thead>
<tr>
<th>Table 6. Risk Factors for Elder Abuse</th>
</tr>
</thead>
</table>
| **Situational Factors**                | Isolation
|                                       | Unstable or unsafe living arrangements
|                                       | Lack of family, community or living facility resources for additional care
| **Victim Characteristics**             | Physical or emotional dependence on caregiver
|                                       | Lack of close family ties
|                                       | History of family violence
|                                       | Dementia or recent deterioration in health
| **Perpetrator Characteristics**        | Related to victim
|                                       | Living with victim
|                                       | Long duration of care for victim (mean 9.5 yr)
|                                       | Financial, marital, occupational or other stressors
|                                       | Has mental disorder or alcohol/substance abuse

**Red Flags for Elder Abuse**
• Delay in seeking medical attention
• Disparity in histories
• Implausible or vague explanations
• Frequent emergency room visits for exacerbations of chronic disease despite plan for medical care and adequate resources
• Presentation of functionally impaired patient without designated caregiver
• Lab findings inconsistent with history
• Physical signs: bruising, broken bones, injuries
• Suspicious changes in accounts: POA, wills
• Deserted in public place
Caregiver Abuse Screen (CASE)

- **instructions**
  - to be answered by caregivers, if answer "yes" to a question, further explore issue
  - the more "yes" responses, the more likely the presence of abuse

- **screening tool**
  - please answer the following questions as a helper/caregiver:
    1. Do you sometimes have trouble making _____ control his/her temper or aggression?
    2. Do you often feel you are being forced to act out of character/do things you feel badly about?
    3. Do you find it difficult to manage _____’s behaviour?
    4. Do you sometimes feel that you are forced to be rough with _____?
    5. Do you sometimes feel that you can’t do what is really necessary or what should be done for _____?
    6. Do you often feel you have to reject/ignore ______?
    7. Do you often feel so tired and exhausted that you cannot meet _____’s needs?
    8. Do you often feel you have to yell at ____?

From: NICE. Case: Caregiver Abuse Screen. 2010. Reproduced with permission from NICE.

**Management**

- interview patient alone
- assess safety and determine capacity to make decisions about living arrangements
- establish need for hospitalization or alternate accommodation (e.g. immediate risk of physical harm by self or caregiver)
- involve multidisciplinary team (e.g. nurse, social worker, family members, and physicians including geriatrician, psychiatrist or family physician)
- educate and assist caregiver, contact local resources (e.g. legal aid, crisis support, PSW, caregiver support groups)
- interpret critical and lab findings that are key in exclusion, differentiation and diagnosis

**Immunizations**

- the following immunizations are recommended for people ≥65 yr
  - tetanus and diptheria: Td every 10 yr
  - pneumococcus
    - if no previous vaccinations, PCV13 followed by PPSV23 in the following yr
    - if previously received PCV13, a second dose is not required
  - influenza every autumn
  - herpes zoster: one time dose

**Presbycusis**

- see Otolaryngology, OT19

**Driving Competency**

**Reporting Requirements**

- physician-reporting to the Ministry of Transportation is mandatory in all provinces and territories except in Quebec, Nova Scotia, and Alberta, where it is discretionary
- British Columbia, Ontario: must refer for re-test at ≥ 80 yr
- not an issue unique to geriatrics – any patient may suffer from a medical condition that impairs their ability to drive should be reported
- in the U.S., varies by state
### Conditions that may Impair Driving

<table>
<thead>
<tr>
<th>Condition</th>
<th>Impairment Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Alcohol</strong></td>
<td>Patients with history of impaired driving and those with high probability of future impaired driving should not drive until further assessed. Alcohol dependence or abuse: if suspected, should be advised not to drive. Alcohol withdrawal seizure: must complete a rehabilitation program and remain abstinent and seizure-free for 6 mo before driving.</td>
</tr>
<tr>
<td><strong>Blood Pressure Abnormalities</strong></td>
<td>Hypertension: sustained BP &gt;170/110 should be evaluated carefully. Hypotension: sustained BP &lt;90/60; if syncopal, discontinue until attacks are treated and preventable.</td>
</tr>
<tr>
<td><strong>Cardiovascular Disease</strong></td>
<td>Suspected asymptomatic CAD or stable angina: no restrictions. STEMI, NSTEMI with significant LV damage, coronary artery bypass surgery: no driving for one mo following hospital discharge. NSTEMI with minor LV damage, unstable angina: no driving for 48 h if PCI or 7 d if no PCI performed.</td>
</tr>
<tr>
<td><strong>Cerebrovascular Conditions</strong></td>
<td>TIA: should not be allowed to drive until a medical assessment is completed. Stroke: should not drive for at least one mo; may resume driving if functionally able; no clinically significant motor, cognitive, perceptual or vision deficits; no obvious risk of sudden recurrence; underlying cause appropriately treated; no post-stroke seizure.</td>
</tr>
<tr>
<td><strong>COPD</strong></td>
<td>Mild/moderate impairment: no restrictions. Moderate or severe impairment requiring supplemental oxygen: road test with supplemental oxygen.</td>
</tr>
<tr>
<td><strong>Cognitive Impairment/Dementia</strong></td>
<td>Moderate to severe dementia is a contraindication to driving; defined as the “inability to independently perform 2 or more IADLs or any basic ADL”. Patients with mild dementia should be assessed; if indicated refer to specialized driving testing centre; if deemed fit to drive, re-evaluate patient every 6-12 mo. Poor performance on MMSE, clock drawing or Trails B suggests a need to investigate driving ability further. MMSE score alone (whether normal or low) is insufficient to determine fitness to drive.</td>
</tr>
<tr>
<td><strong>Diabetes</strong></td>
<td>Diet controlled or oral hypoglycemic agents: no restrictions in absence of diabetes complications that may impair ability to drive (e.g. retinopathy, nephropathy, neuropathy, cardiovascular or cerebrovascular disease). Insulin use: may drive if no complications (as above) and no severe hypoglycemic episode in the last 6 mo.</td>
</tr>
<tr>
<td><strong>Drugs</strong></td>
<td>Be aware of: analgesics, anticholinergics, anticonvulsants, antidepressants, antipsychotics, opiates, sedatives, stimulants. Degree of impairment varies: patients should be warned of the medication/withdrawal effect on driving.</td>
</tr>
<tr>
<td><strong>Hearing Loss</strong></td>
<td>Effect of impaired hearing on ability to drive safely is controversial. Acute labyrinthitis, positional vertigo with horizontal head movement, recurrent vertigo: advise not to drive until condition resolves.</td>
</tr>
<tr>
<td><strong>Musculoskeletal Disorders</strong></td>
<td>Physician’s role is to report etiology, prognosis and extent of disability (pain, range of motion, coordination, muscle strength).</td>
</tr>
<tr>
<td><strong>Post-Operative</strong></td>
<td>Outpatient, conscious sedation: no driving for 24 h. Outpatient, general anesthesia: no driving for ≥24 h.</td>
</tr>
<tr>
<td><strong>Seizures</strong></td>
<td>First, single, unprovoked: no driving for 3 mo until complete neurologic assessment, EEG, CT head. Epilepsy: can drive if seizure-free on medication and physician has insight into patient compliance.</td>
</tr>
<tr>
<td><strong>Sleep Disorders</strong></td>
<td>If patient is believed to be at risk due to a symptomatic sleep disorder but refuses investigation with a sleep study or refuses appropriate treatment, the patient should not drive.</td>
</tr>
<tr>
<td><strong>Visual Impairment</strong></td>
<td>Visual acuity: contraindicated to drive if &lt;20/50 with both eyes examined simultaneously. Visual field: contraindicated to drive if &lt;120° along horizontal meridian and 15° continuous above and below fixation with both eyes examined simultaneously.</td>
</tr>
</tbody>
</table>

N.B. guidelines included refer specifically to private driving; please see CMA guidelines for commercial driving.
Health Care Institutions

Table 8. Classification of Health Care Services and Institutions

<table>
<thead>
<tr>
<th>Institution/Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community Support Services</td>
<td>Health care services offered at home for those who can live independently at home or under the care of family members including professional health care services, personal care and support (ADL assistance), homemaking (IADL assistance), community support services (e.g. transportation, meal delivery, day programs, caregiver relief, security checks, etc.)</td>
</tr>
<tr>
<td>Rehabilitation</td>
<td>Health care services offered in an institution to optimize patients’ function, independence and quality of life</td>
</tr>
<tr>
<td>Residential</td>
<td>Divided into short (&lt;60-90 d/yr) and long (indefinite) stay</td>
</tr>
<tr>
<td>a) Seniors Affordable Housing</td>
<td>Seniors who live independently and manage their own care but prefer to live near other seniors; usually has accessibility features and rent is adjusted based on income</td>
</tr>
<tr>
<td>b) Retirement Home</td>
<td>Residents are fairly independent and require minimal support with ADLs and IADLs; often privately owned</td>
</tr>
<tr>
<td>c) Supportive Housing</td>
<td>Residents require minimal to moderate assistance with daily activities while living independently; often rental units in an apartment and may offer some phys therapy and rehabilitation services</td>
</tr>
<tr>
<td>d) Long-term Care/Skilled Nursing Facility</td>
<td>Around the clock nursing care and on-call physician coverage; often offers occupational therapy, physiotherapy, respiratory therapy, and rehabilitation services; may be used short-term for caregiver respite or for supportive patient care to regain strength and confidence after leaving the hospital</td>
</tr>
<tr>
<td>e) Hospice</td>
<td>Free-standing facility or designated floor in a hospital or nursing home for care of terminally ill patients and their families; focus is on quality of life and often requires prognosis ≤ 3 mo</td>
</tr>
</tbody>
</table>

- names of community health care institutions, types of facilities, and services offered vary between geographical locations
- factors to consider when seeking services/institutions include level of care required, support networks, duration of stay, and cost

Palliative and End-of-Life Care

Principles and Quality of Life

- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

End-of-Life Care Discussions

When to initiate End-of-Life Care Discussions
- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient inquires about end-of-life care

Suggested Topics for Discussion
- goals of care (disease vs. symptom management)
- advance directives, power of attorney, public guardian and trustee
- location (e.g. hospice, home, palliative care facility etc.)
- patient wishes (medical assistance/feasibility to fulfill)
- physician assisted death (patient initiated discussion)
- treatment options and likelihood of success
- common medical interventions
  - mechanical ventilation
  - antibiotic therapy
  - feeding tubes
- resuscitation options and likelihood of success (Full Code vs. DNR status including preferences for CPR intubation, ICU admission, artificial hydration)

Guidance on the Management of Pain in Older People

*Age and Aging* 2013; 42:1-57
The three most common sites of pain in older adults are the back, leg/knee and hip. Acetaminophen should be considered first line treatment for the management of both acute and persistent pain, particularly that which is of musculoskeletal origin. NSAIDs should be prescribed with caution and co-prescribed with a PPI.
Power of Attorney

- see Ethical, Legal, and Organizational Medicine, ELOM10

Instructional Advance Directives

- see Ethical, Legal, and Organizational Medicine, ELOM10

Symptom Management

Assessment Tools

- Edmonton Symptom Assessment System (ESAS): a tool that asks patients to rate the intensity of symptoms from 0 to 10 and allows for tracking of the efficacy of interventions. Assesses: pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well-being, shortness of breath, and “other problems”
- Palliative Performance Scale (PPS): a tool that uses functional status to predict survival in terminally ill patients. Assesses 5 components: ambulation, activity and evidence of disease, self-care, intake and conscious level

Source: J Palliat Care 1991;7:6-9 and Victoria Hospice Society 2006;120-121

Table 9. Management of Common End-of-Life Symptoms

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Non-Pharmacologic Management</th>
<th>Pharmacologic Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constipation</td>
<td>Rule out obstruction, impaction, anorectal disease; hydration and high fibre intake; increase mobility</td>
<td>Stop unnecessary opioids and medications with anticholinergic side effects; increase peristalsis (e.g. sempra), alter water and electrolyte secretion (e.g. magnesium hydroxide, lactulose, peg3350)</td>
</tr>
<tr>
<td>Terminal Pulmonary Secretions (“Death Rattle”)</td>
<td>Oral suctioning Discontinue unnecessary IV solutions Oral hygiene Re-positioning (on side, elevated)</td>
<td>Scopolamine SC or transdermal Hydrocortisone, Glycopyronium, Atropine</td>
</tr>
<tr>
<td>Dry mouth</td>
<td>Oral hygiene q2h, ice cubes, sugarless gum</td>
<td>Artificial saliva substitutes, Biotene TM products, Baking Soda mouth rinse, bethanechol, plopcarbine 1% solution as no thrice</td>
</tr>
<tr>
<td>Dysphagia</td>
<td>Frequent small feeds, ideally seated, keep head of bed elevated for 30 min after eating, suction as necessary</td>
<td>Treat painful mucositis (diphenhydramine; lidocaine: Maalox® in a 1:2:8 mixture), candidiasis (fluconazole)</td>
</tr>
<tr>
<td>Dyspnea</td>
<td>Elevate head of bed, eliminate allergens, open window/ use fan</td>
<td>Oxygen, bronchodilators, opioids (e.g. morphine, hydromorphone)</td>
</tr>
<tr>
<td>Hiccups</td>
<td>Dry sugar, breathing in paper bag</td>
<td>Chlorpromazine, haloperidol, metoclopramide, baclofen, marijuana</td>
</tr>
<tr>
<td>Nausea and Vomiting</td>
<td>Frequent and small meals, avoid offensive strong colours, treat constipation if present</td>
<td>Raised ICP: dexamethasone Anticipatory nausea, anxiety: lorazepam Vestibular disease, vertigo: dimenhydrate Drug induced, hepatic or renal failure: prochlorperazine, haloperidol GERD: PPI or H2 antagonist Gastric stasis: metoclopramide Bowel obstruction: metoclopramide, dexamethasone, octreotide</td>
</tr>
<tr>
<td>Pain</td>
<td>Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance and CBT</td>
<td>Nonopiceptive pain: NSAIDs, acetaminophen, weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl) Neuropathic pain: antidepressants (TCAs, SSRIs), steroids (dexamethasone) Bony pain: non-opioids, weak opioids, bisphosphonates, radiation therapy</td>
</tr>
<tr>
<td>Pruritus</td>
<td>Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice</td>
<td>Antihistamines, phenothiazines, topical corticosteroids, calamine lotion</td>
</tr>
<tr>
<td>Fatigue</td>
<td>Modify environment and activities to decrease energy expenditure</td>
<td>Treat insomnia, anemia, depression; consider psychostimulants (e.g. Dexmethylasone, Dextroamphetamine, Methylenphedate)</td>
</tr>
<tr>
<td>Psychiatric</td>
<td>Spiritual counselling CBT Support groups Art/Music Therapy</td>
<td>Anxiety: benzodiazepines Agitation: antipsychotics Confusion/Delirium: treat underlying etiology Depression: Standard SSRIs, SNRIs may be too slow depending on patient prognosis, consider psychostimulants (e.g. methylphenidate, ketamine)</td>
</tr>
</tbody>
</table>

<tr>
<td>Codeine Not recommended</td>
<td>180-240 mg</td>
</tr>
<tr>
<td>Oxycodone Not recommended</td>
<td>10-15 mg</td>
</tr>
<tr>
<td>Hydromorphone 2 mg</td>
<td>4-6 mg</td>
</tr>
</tbody>
</table>

Fentanyl transdermal 25 µg/h = morphine 90 mg q4h or OD, however fentanyl takes 12-16 h to reach steady state N.B. Dosing may need to be adjusted in the elderly adult population

Necrotic Pain

Somatic: localized to bone/skin/joint/muscle; graving, dull pain Visceral: not well localized; crampy pain, pressure

Neuropathic Pain

Burning, shooting, radiating pain; localized to dermatomal regions

Serum creatinine does not reflect creatinine clearance in the elderly

Instead, use: CrCI = (weight in kg x 140 – age) x 1.23 (mL/min) (serum creatinine in µmol/L)

Multiply by 0.85 for females
Geriatric Pharmacology

Pharmacokinetics

Table 10. Age-Associated Pharmacokinetics

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Age Effect</th>
<th>Implications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absorption</td>
<td>Increased gastric pH</td>
<td>Drug-drug and drug-food interactions are more likely to affect absorption</td>
</tr>
<tr>
<td>(less significant)</td>
<td>Decreased splanchnic blood flow, GI absorptive surface and dermal vascularity; delayed gastric emptying</td>
<td></td>
</tr>
<tr>
<td>Distribution</td>
<td>Increased total body fat and α1-glycoprotein</td>
<td>Lipophilic drugs have a larger volume of distribution</td>
</tr>
<tr>
<td></td>
<td>Decreased lean body mass, total body water, and albumin</td>
<td>Decreased binding of acidic drugs, increased binding of basic drugs</td>
</tr>
<tr>
<td>Metabolism</td>
<td>Decreased hepatic mass and hepatic blood flow; impaired phase I reactions (oxidative system)</td>
<td>Lower doses may be therapeutic</td>
</tr>
<tr>
<td>(less significant)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Pharmacodynamics

Drug Sensitivity
- changes in pharmacokinetics as well as intrinsic sensitivity lead to altered drug responses
- increased sensitivity to warfarin, sedatives, antipsychotics, digoxin and narcotics
- decreased sensitivity to β-blockers in majority of elderly patients, though some may have increased sensitivity

Decreased Homeostasis
- poorer compensatory mechanisms leading to more adverse reactions (e.g. bleeding with NSAIDs/anticoagulants, altered mental status with anticholinergic/sympathomimetic/anti-Parkinsonian drugs)

Polypharmacy

Definition
- prescription, administration or use of five or more medications at the same time

Epidemiology
- in Canada, >60% of elderly individuals reported using ≥5 medications
- hospitalized elderly are given an average of 10 medications during admission

Risk Factors for Non-Compliance
- risk of non-compliance correlates with medication factors, not age
  - number of medications: compliance with 1 medication is 80%, but drops to 25% with ≥6 medications
  - increased dosing frequency, complicated container design, financial constraints, and cognitive impairment

Adverse Drug Reactions (ADRs)
- any noxious or unintended response to a drug that occurs at doses used for prophylaxis or therapy
- risk factors in the elderly
  - intrinsic: comorbidities, age-related changes in pharmacokinetics and pharmacodynamics
  - extrinsic: number of medications, multiple prescribers, unreliable drug history
- 90% of ADRs are from: ASA, analgesics, anticoagulants, antimicrobials, antineoplastics, digoxin, diuretics, hypoglycemics, and steroids

Preventing Polypharmacy
- consider drug: safer side effect profiles, convenient dosing schedules, convenient route, efficacy
- consider patient: other medications, clinical indications, medical comorbidities
- consider patient-drug interaction risk factors for ADRs
- review drug list regularly to eliminate medications with no clinical indication or with evidence of toxicity
- avoid treating an ADR with another medication
Inappropriate Prescribing in the Elderly

Epidemiology
- the estimated prevalence of potentially inappropriate prescribing ranges from 12-40%

Beers Criteria
- a list of medications to avoid in adults ≥65 yo due to safety concerns
- examples include long-acting benzodiazepines, strong anticholinergics, high-dose sedatives
- the elderly are also often under-treated (ACEI, ASA, β-blockers, thrombolytics, warfarin)

Beers Criteria
For full list of medications, consult the following reference:
The American Geriatrics Society 2012 Beers Criteria Update Expert Panel
J Am Geriatr Soc 2012;60(4):616-31

Figure 1. Vulva and perineum

A. EXTERNAL GENITALIA
- referred to collectively as the vulva
- blood supply: internal pudendal artery
- sensory innervation: pudendal nerve
- lymphatic drainage: inguinal nodes

B. VAGINA
- muscular canal extending from cervix to vulva, anterior to rectum and posterior to bladder
- lined by rugated, stratified-squamous epithelium
- upper vagina separated by cervix into anterior, posterior, and lateral fornices
- blood supply: vaginal branch of internal pudendal artery with anastomoses from uterine, inferior vesical, and middle rectal arteries

C. UTERUS
- thick walled, muscular organ between bladder and rectum, consisting of two major parts:
  - uterus corpus
    - blood supply: uterine artery (branch of the internal iliac artery, anterior division)
  - cervix
    - blood supply: cervical branch of uterine artery
- supported by the pelvic diaphragm, the pelvic organs, and 4 paired sets of ligaments
- round ligaments: travel from anterior surface of uterus, through broad ligaments, and inguinal canals then terminate in the labia majora
  - function: anteversion
- blood supply: Sampson's artery (branch of uterine artery running through round ligament)
- uterosacral ligaments: arise from sacral fascia and insert into posterior inferior uterus
  - function: mechanical support for uterus, prevent prolapse and contain autonomic nerve fibres
- cardinal ligaments: extend from lateral pelvic walls and insert into lateral cervix and vagina
  - function: mechanical support, prevent prolapse
- broad ligaments: pass from lateral pelvic wall to sides of uterus; contain fallopian tube, round ligament, ovarian ligament, nerves, vessels, and lymphatics
• infundibulopelvic ligament: continuous tissue that connects ovary to pelvic wall
  - contains the ovarian artery, ovarian vein, ovarian plexus, and lymphatic vessels
• position of the uterus
  - anteverted (majority), retroverted, neutral

---

**D. FALLOPIAN TUBES**

- 8-14 cm muscular tubes extending laterally from the uterus to ovary
- interstitial, isthmic, ampullary, and infundibular segments; terminates at fimbriae
- mesosalpinx: peritoneal fold that attaches fallopian tube to broad ligament
- blood supply: uterine and ovarian arteries

**E. OVARIES**

- consist of cortex with ova and medulla with blood supply
- supported by infundibulopelvic ligament (suspensory ligament of ovary)
- mesovarium: peritoneal fold that attaches ovary to broad ligament
- blood supply: ovarian arteries (branches off aorta), left ovarian vein (drains into left renal vein), right ovarian vein (drains into inferior vena cava)

</table>

**CHARACTERISTICS**

- Menarche 10-15 yr
- Average 12.2 yr
- Entire cycle 28 ± 7 d with bleeding for 1-6 d
- 25-80 mL blood loss per cycle

**ESTROGEN**

ESTROGEN is the main hormone in the follicular/proliferative phase and is stimulated by FSH. As the level increases it acts negatively on FSH. The majority of estrogen is secreted by the dominant follicle.

Estrogen effects

- On the follicles in the ovaries
- Reduces atresia
- On the endometrium
- Proliferation of glandular and stromal tissue
- On all target tissues
- Decreases E receptors

**PROGESTERONE**

PROGESTERONE is the main hormone in the luteal/secretory phase and is stimulated by LH. Increased progesterone acts negatively on LH and is secreted by the corpus luteum (remnant of dominant follicle).

Progesterone effects

- On the endometrium
  - Cessation of mitoses (stops building endometrium up)
  - "Organization" of glands (initiates secretions from glands)
  - Inhibits macrophages, interleukin-8, and enzymes from degrading endometrium
- On all target tissues
  - Decrease E receptors (the "anti-estrogen" effect)
  - Decrease P receptors
Stages of Puberty

- see Pediatrics, P30
- adrenarche: increase in secretion of adrenal androgens; usually precedes gonadarche by 2 yr
- gonadarche: increased secretion of gonadal sex steroids; ~age 8 yr
- thelarche: breast development
- pubarche: pubic and axillary hair development
- menarche: onset of menses, usually following peak height velocity and/or 2 yr following breast budding

Premenstrual Syndrome

- synonyms: "ovarian cycle syndrome," "menstrual molimina" (moodiness)

Etiology

- multifactorial: not completely understood; genetics likely play a role
- CNS-mediated neurotransmitter interactions with sex steroids (progesterone, estrogen, and testosterone)
- serotonergic dysregulation – currently most plausible theory

Diagnostic Criteria for Premenstrual Syndrome

- at least one affective and one somatic symptom during the 5 d before menses in each of the three prior menstrual cycles
  - affective: depression, angry outbursts, irritability, anxiety, confusion, social withdrawal
  - somatic: breast tenderness, abdominal bloating, headache, swelling of extremities
- symptoms relieved within 4 d of onset of menses
- symptoms present in the absence of any pharmacologic therapy, drug or alcohol use
- symptoms occur reproducibly during 2 cycles of prospective recording
- patient suffers from identifiable dysfunction in social or economic performance

Premenstrual Dysphoric Disorder

Clinical Presentation

- irritability, depressed mood
- breast pain and bloating

Diagnostic Criteria for Premenstrual Dysphoric Disorder

- at least 5 of the following 11 symptoms during most menstrual cycles of the last year (with at least 1 of the first 4)
  - depressed mood or hopelessness
  - anxiety or tension
  - affective symptoms
  - anger or irritability
  - decreased interest in activities
  - difficulty concentrating
  - lethargy
  - change in appetite
  - hypersomnia or insomnia
  - feeling overwhelmed
  - physical symptoms: breast tenderness/swelling, headaches, joint/muscle pain, bloating, or weight gain
- symptoms interfere with social or occupational functioning
- symptoms must be discreetly related to the menstrual cycle
- 1, 2 and 3 must be confirmed during at least 2 consecutive symptomatic menstrual cycles
Differential Diagnoses of Common Presentations

Abnormal Uterine Bleeding

Abnormal Uterine Bleeding (AUB)
- Heavy Menstrual Bleeding
- Intermenstrual Bleeding

Structural Causes (PALM)
- Polyp (AUB-P)
- Adenomyosis (AUB-A)
- Leiomyoma (AUB-L)
- Submucosal (AUB-L_{sm})
- Other (AUB-LO)
- Malignancy and hyperplasia (AUB-M)

Non-Structural Causes (COEIN)
- Coagulopathy (AUB-C)
- Ovulatory dysfunction (AUB-D)
- Endometrial (AUB-E)
- Iatrogenic (AUB-I)
- Not yet classified (AUB-N)

Figure 6. Differential diagnosis of abnormal uterine bleeding

- see Disorders of Menstruation, GY11
- menstrual bleeding should be evaluated by ascertaining: frequency/regularity of menses, duration, volume of flow, affects on quality of life and timing (inter or premenstrual or breakthrough)
- classified as:
  - regular: cycle to cycle variability of <20 d
  - irregular: cycle to cycle variability of ≥20 d
  - heavy menstrual bleeding: ≥80 cc of blood loss per cycle or ≥8 d of bleeding per cycle or bleeding that significantly affects quality of life
  - postmenopausal bleeding: any bleeding that presents >1 yr after menopause; must rule out endometrial cancer

Dysmenorrhea

- see Disorders of Menstruation, GY13
- primary/idiopathic
- secondary (acquired)
  - endometriosis
  - adenomyosis
  - uterine polyps
  - uterine anomalies (e.g. non-communicating uterine horn)
  - leiomyoma
  - intrauterine synechiae
  - ovarian cysts
  - cervical stenosis
  - imperforate hymen, transverse vaginal septum
  - pelvic inflammatory disease
  - IUD (copper)
  - foreign body

Pruritus

- see Gynecological Infections, GY26
- physiologic discharge and cervical mucus production
- non-physiologic
  - genital tract infection
  - vulvovaginitis: candidiasis, trichomoniasis, BV, polymicrobial superficial infection
  - chlamydia, gonorrhea
  - pyosalpinx, salpingitis
  - genital tract inflammation (non-infectious)
  - local: chemical irritants, douches, sprays, foreign body, trauma, atrophic vaginitis, desquamative inflammatory vaginitis, focal vulvitis
  - neoplasia: vulvar, vaginal, cervical, endometrial
  - systemic: toxic shock syndrome, Crohn’s disease, collagen disease, dermatologic (e.g. lichen sclerosis)
  - IUD, OCP (secondary to progesterone)
Pelvic Pain

20% of chronic pelvic pain patients have a history of previous sexual abuse/assault; remember to ask about it.

Pelvic Mass

Figure 7. Approach to pelvic pain

Figure 8. Differential diagnosis of pelvic mass
Common Investigations and Procedures

Dyspareunia

Figure 9. Approach to dyspareunia

First and Second Trimester Bleeding

Approach to the Patient with Bleeding in T1/T2

History
- risk factors for ectopic pregnancy (see Ectopic Pregnancy, GY21)
- previous spontaneous abortion
- recent trauma
- characteristics of the bleeding (including any tissue passed)
- characteristics of the pain (cramping pain suggests spontaneous abortion)
- history of coagulopathy
- gynecological/obstetric history
- fatigue, dizziness, syncopal episodes due to hypovolemia, fever (may be associated with septic abortion)

Physical
- vitals (including orthostatic changes)
- abdomen (symphysis fundal height, tenderness, presence of contractions)
- perineum (signs of trauma, genital lesions)
- speculum exam (cervical os open or closed, presence of active bleeding/clots/tissue)
- pelvic exam (uterine size, adnexal mass, uterine/adnexal tenderness, cervical motion tenderness)

Investigations
- β-hCG (may be lower than expected for GA in spontaneous abortion, can be used to diagnose viable pregnancy vs. ectopic pregnancy vs. abortion)
- U/S (confirm intrauterine pregnancy and fetal viability)
- CBC
- group and screen

Treatment
- IV resuscitation for hemorrhagic shock
- treat the underlying cause

Common Investigations and Procedures

Imaging

Ultrasound (U/S)
- transabdominal or transvaginal U/S is the imaging modality of choice for pelvic structures
- transvaginal U/S provides better resolution of uterus and adnexal structures
- detects early pregnancy if β-hCG ≥1,500 (β-hCG must be ≥6,500 for transabdominal U/S)
- may be used to identify pelvic pathology
- identify ectopic pregnancy, intrauterine pregnancy
- assess uterine, adnexal, cul-de-sac, ovarian masses (e.g. solid or cystic)
- determine endometrial thickness, locate/characterize fibroids
- monitor follicles during assisted reproduction
- assess endometrial lining in postmenopausal women

Every woman of childbearing age presenting to ER with abdominal or pelvic pain should have β-hCG measured
Endometrial Biopsy

- performed in the office using an endometrial suction curette (pipelle) guided through the cervix to aspirate fragments of endometrium
  - pre-treatment with misoprostol (Cytotec) if nulliparous or postmenopausal
- more invasive procedure (D&C) may be done in the office or operating room ± hysteroscopy. This may be required if endometrial biopsy is not possible in the office setting or if there is suspicion for an endometrial polyp
- indications
  - AUB/PMB
  - age >40
  - risk factors for endometrial cancer
  - failure of medical treatment
  - significant intermenstrual bleeding
  - consider in women with infrequent menses suggesting anovulatory cycles

Hysterectomy

Indications
- uterine fibroids
- endometriosis, adenomyosis
- uterine prolapse
- pelvic pain
- AUB
- cancer (endometrium, ovaries, fallopian tubes, cervix)

Complications
- general anesthetic
- bleeding
- infection
- injury to other organs (ureter, bladder, rectum)
- loss of ovarian function (if ovaries removed, iatrogenic menopause)

Approaches
1. open (abdominal approach): uterus removed via transverse (pfannenstiel) or midline laparotomy
2. minimally invasive approaches
  - vaginal hysterectomy: entire procedure performed through the vagina. No abdominal incisions
  - laparoscopic assisted vaginal hysterectomy: vascular pedicles are divided by a combination of laparoscopic and vaginal approaches
  - total laparoscopic hysterectomy: all vascular pedicles including the colpotomy approached laparoscopically
  - robotic: a type of laparoscopic approach. May be advantageous in high BMI patients. More costly

</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Investigations

Figure 10 Diagnostic approach to amenorrhea
• β-hCG, hormonal workup (TSH, prolactin, FSH, LH, androgens, estradiol)
• progesterone challenge to assess estrogen status
  ■ medroxyprogesterone acetate (Provera®) 10 mg PO OD for 10-14 d
  ■ any uterine bleed within 2-7 d after completion of Provera® is considered to be a positive test/
    withdrawal bleed
    • withdrawal bleed suggests presence of adequate estrogen to thicken the endometrium; thus
      withdrawal of progesterone results in bleeding
    • if no bleeding occurs, this may be secondary to inadequate estrogen (hypoestrogenism),
      excessive androgens, or progesterones (decidualization) or pregnancy
• karyotype: indicated if primary ovarian insufficiency or absent puberty
• U/S to confirm normal anatomy, identify PCOS

Treatment

Abnormal Uterine Bleeding

Figure 11. Diagnostic approach to abnormal uterine bleeding
**Disorders of Menstruation**

**Approach**
- **is it regular?**
  - regular: cycle to cycle variability of <20 d – “Can you predict your menses within 20 days?”
  - irregular: cycle to cycle variability of ≥20 d
- **is it heavy**
  - ≥80 cc of blood loss per cycle or
  - ≥8 d of bleeding per cycle or
  - bleeding that significantly affects quality of life
- **is it structural?**
  - PALM
- **is it non-structural?**
  - COEIN

*Ferrous gluconate 300 mg PO TID w ll raise Hb 10 points per wk

**Treatment**
- resuscitate patient if hemodynamically unstable
- treat underlying disorders
  - if anatomic lesions and systemic disease have been ruled out, consider AUB
- medical
  - mild AUB
    - NSAIDs
    - anti-fibrinolytic (e.g. Cyklokapron*) at time of menses
    - combined OCP
    - progestins (Provera*) on first 10-14 d of each month or every 3 mo if AUB-O
    - Mirena* IUD
    - Danazol
    - Correct anemia - iron
  - acute, severe AUB
    - replace fluid losses, consider admission
    - estrogen (Premarin*) 25 mg IV q4h x 24 h with Gravol* 50 mg IV/PO q4h or anti-fibrinolytic (e.g. Cyklokapron*) 10 mg/kg IV q8h
    - tapering OCP regimen, 35µg pill TID x7d then taper to 1 pill/d for 3w with Gravol* 50 mg IV/PO q4h
    - or taper to 1 tab tid x 2 d → bid x 2 d → OD
  - after (a) or (b), maintain patient on monophasic OCP for next several months or consider alternative medical treatment
surgical
  - endometrial ablation
    - if finished childbearing
    - repeat procedure may be required if symptom recur especially if <40 yr
  - hysterectomy: definitive treatment

Dysmenorrhea

Etiology
  - see Differential Diagnoses of Common Presentations, GY6

</tr>
<tr>
<td></td>
<td>U/S, laparoscopy and hysteroscopy may be necessary to establish the diagnosis Screening for infections (vaginal and cervical cultures) may be required</td>
<td></td>
</tr>
<tr>
<td>Treatment</td>
<td>NSAIDs: should be started before onset of pain OCP: suppress ovulation/reduce menstrual flow</td>
<td>Treat underlying cause</td>
</tr>
</tbody>
</table>

Endometriosis

Etiology
  - not fully understood
  - proposed mechanisms (combination likely involved)
    - retrograde menstruation (Sampson's theory)
    - immunologic theory: altered immunity may limit clearance of transplanted endometrial cells from pelvic cavity (may be due to decreased NK cell activity)
    - metaplasia of coelomic epithelium
    - extrapelvic disease may be due to aberrant vascular or lymphatic dissemination of cells
    - e.g. ovarian endometriosis may be due to direct lymphatic flow from uterus to ovaries

Epidemiology
  - incidence: 15-30% of pre-menopausal women
  - mean age at presentation: 25-30 yr
  - regresses after menopause

Risk Factors
  - family history (7-10x increased risk if affected 1st degree relative)
  - obstructive anomalies of the genital tract (earlier onset) – resolve with treatment of anomaly
  - nulliparity
  - age >25 yr

Sites of Occurrence
  - ovaries: 60% patients have ovarian involvement
  - broad ligament, vesicouterine fold
  - peritoneal surface of the cul de sac, uterosacral ligaments
  - rectosigmoid colon, appendix
  - rarely may occur in sites outside abdomen/pelvis, including lungs
Clinical Features

- may be asymptomatic and can occur with one of 3 presentations
  
  1. pain
    - menstrual symptoms
      - cyclic symptoms due to growth and bleeding of ectopic endometrium, usually precede menses (24-48 h) and continue throughout and after flow
      - secondary dysmenorrhea
      - sacral backache with menses
      - pain may eventually become chronic, worsening perimenstrually
      - deep dyspareunia
    - bowel and bladder symptoms
      - frequency, dysuria, hematuria
      - cyclic diarrhea/constipation, hematochezia, dyschezia (suggestive of deeply infiltrating disease)
  
  2. infertility
    - 30–40% of patients with endometriosis will be infertile
    - 15–30% of those who are infertile will have endometriosis
  
  3. mass (endometrioma)
    - ovarian mass can present with any of above symptoms or be asymptomatic
    - physical
      - tender nodularity of uterine ligaments and cul-de-sac felt on rectovaginal exam
      - fixed retroversion of uterus
      - firm, fixed adnexal mass (endometrioma)

Investigations

- definitive diagnosis can be made based on:
  - direct visualization of lesions typical of endometriosis at laparoscopy
  - biopsy and histologic exam of specimens (2 or more of: endometrial epithelium, glands, stroma, hemosiderin-laden macrophages)

- laparoscopy
  - mulberry spots: dark blue or brownish-black implants on the uterosacral ligaments, cul-de-sac, or anywhere in the pelvis
  - endometrioma: "chocolate" cysts on the ovaries
  - "powder-burn" lesions on the peritoneal surface
  - early white lesions and clear blebs
  - peritoneal "pockets"
  - CA-125
    - may be elevated in patients with endometriosis but should NOT be used as a diagnostic test

Figure 12. SOGC guidelines for treatment of endometriosis

Treatment

- surgical confirmation of disease is NOT required prior to starting medical management. Asymptomatic endometriosis does not require treatment. Management depends on certainty of the diagnosis, severity of symptoms, extent of disease, desire for future fertility, and impact to GI/GU systems (e.g. intestinal obstruction)
- medical
  - NSAIDs (e.g. naproxen sodium – Anaprox®)
  - 1st line
    - cyclic/continuous estrogen-progestin (OCP)
    - progestin (IM medroxyprogesterone (Depo-Provera®) or oral dienogest (Visanne®)
    - Mirena® IUS
  - 2nd line
    - GnRH agonist with addback
    - Progestin IUS
  - 3rd line
    - Reconsider diagnosis additional testing and/or non-gynecologic referrals
    - Chronic pain management and multidisciplinary support

Endometriosis – Take Home Points

- Suggestive history even with a negative exam should be considered adequate for a presumptive diagnosis
- Pelvic pain that is not primary dysmenorrhea should be considered endometriosis until proven otherwise
- Medical management is the mainstay of endometriosis
Adenomyosis

- synonym: “endometriosis interna” (uterine wall may be diffusely involved)

**Epidemiology**
- 15% of females >35 yr old; found in 20-40% of hysterectomy specimens
- mean age at presentation: 40-50 yr old (older age group than seen in endometriosis)
- adenomyosis is a common histologic finding in asymptomatic patients

**Clinical Features**
- often asymptomatic
- heavy menstrual bleeding, secondary dysmenorrhea, pelvic discomfort
- dyspareunia, dyschezia
- uterus symmetrically bulky, usually <14 cm
- Halban sign: tender, softened uterus on premenstrual bimanual exam

**Investigations**
- clinical diagnosis
- U/S or MRI can be helpful
- endometrial sampling to rule out other pathology

**Treatment**
- iron supplements for anemia
- analgesics, NSAIDs
- OCP, medroxyprogesterone (Depo-Provera*)
- GnRH agonists (e.g. leuprolide)
- Mirena* IUS
- low dose danazol 100-200 mg PO OD (trial x 4 mo)
- definitive: hysterectomy

---

Fibroids

**Epidemiology**
- diagnosed in approximately 40-50% of pre-menopausal women >35 yr
- more common in African Americans, where they are also larger and occur at earlier age
- common indication for major surgery in females
- minimal malignant potential (1:1,000)
- typically regress after menopause; enlarging fibroids/uterus in a postmenopausal woman should prompt consideration of malignancy, specifically sarcoma

**Pathogenesis**
- estrogen stimulates monoclonal smooth muscle proliferation
- progesterone stimulates production of proteins that inhibit apoptosis
- degenerative changes (occur when tumour outgrows blood supply)
  - fibroids can degenerate, become calcified, have sarcomatous component or obtain parasitic blood supply

**Clinical Features**
- majority asymptomatic (60%), often discovered as incidental finding on pelvic exam or U/S
- abnormal uterine bleeding (30%): dysmenorrhea, heavy menstrual bleeding
- pressure/bulk symptoms (20-50%)
  - pelvic pressure/heaviness
  - increased abdominal girth
  - urinary frequency and urgency
  - acute urinary retention (extremely rare but surgical emergency!)
  - constipation, bloating (rare)
• acute pelvic pain
  • fibroid degeneration
  • fibroid torsion (if pedunculated subserosal)
• infertility, recurrent pregnancy loss
• pregnancy complications (potential enlargement and increased pain, obstructed labour, difficult C-section)

**Investigations**
- bimanual exam: uterus asymmetrically enlarged, usually mobile
- CBC: anemia
- U/S: to confirm diagnosis and assess location of fibroids
- sonohysterogram: useful for differentiating endometrial polyps from submucosal fibroids, or if intracavitary growth
- endometrial biopsy to rule out uterine cancer for abnormal uterine bleeding (especially if age >40 yr)
- occasionally MRI is used for pre-operative planning (e.g. before myomectomy)

**Treatment**
- only if symptomatic, rapidly enlarging, heavy menstrual bleeding, menometrorrhagia, or intracavitary
- treat anemia if present
- conservative approach (watch and wait) if:
  - symptoms absent or minimal
  - fibroids <6-8 cm or stable in size
  - not submucosal (submucosal fibroids are more likely to be symptomatic)
  - currently pregnant due to increased risk of bleeding (follow-up U/S if symptoms progress)
- medical approach to treat AUB-L
  - antiprostaglandins (ibuprofen, other NSAIDs)
  - tranexamic acid (Cyklokapron®)
  - OCP/Depo-Provera*
  - GnRH agonist: leuprolide (Lupron®)
    - often used pre-myomectomy or pre-hysterectomy to reduce fibroid size
    - reduced bleeding and correct anemia
    - can be used long term to bridge to menopause in combination with add back progestin or estrogen
  - ulipristal acetate: a selective progesterone receptor agonist
    - 5 mg daily for 3 mo
    - courses can be repeated provided patients menstruate in between
    - shown to control menstrual bleeding symptoms and shrink fibroid
    - associated with benign, non-physiological endometrial changes (selective progesterone receptor
      modulator-associated endometrial changes PAEC) which are reversible with discontinuation of
      therapy
- interventional radiology approach
  - uterine artery embolization (occludes both uterine arteries) → shrinks fibroids by 50% at 6 mo;
    improves heavy bleeding in 90% of patients within 1-2 mo; not an option in women considering
    childbearing
- surgical approach
  - myomectomy (hysteroscopic, transabdominal, or laparoscopic): preserves fertility
  - hysteroscopic resection of fibroid and endometrial ablation for AUB-Lsm
  - hysterectomy (see Hysterectomy, GY9)
    - note: avoid operating on fibroids during pregnancy (due to → vascularity and potential pregnancy
      loss); expectant management usually best

---

**Ulipristal Acetate vs. Leuprolide Acetate for Uterine Fibroids**
*NEJM* 2012;366:421-432

**Study:** Phase III, double-blind RCT of the efficacy and side-effect profile of ulipristal acetate versus those of leuprolide acetate for the treatment of symptomatic uterine fibroids before surgery.

**Outcomes:** Control of uterine bleeding at week 13 was the primary outcome. Secondary outcomes included bleeding pattern, amenorrhea, changes in fibroid/uterine volume, and global pain score.

**Patients:** 307 premenopausal women with symptomatic fibroids and excessive uterine bleeding were randomly assigned to oral ulipristal acetate (5 mg or 10 mg) or intramuscular injections of leuprolide acetate.

**Results:** Control of bleeding at week 13 was not significantly different between the treatment groups. All three treatments reduced uterine volume, although this decrease was significantly greater in the leuprolide group (47% reduction) than in the ulipristal groups (20-22%). 40% of the leuprolide group reported moderate-to-severe hot flashes, but only 11% (5 mg) and 10% (10 mg) of the ulipristal groups did.

**Conclusions:** Oral ulipristal acetate (5 mg or 10 mg) is noninferior to intramuscular leuprolide acetate for control of uterine bleeding due to fibroids, and it had a better side-effect profile.
Contraception

Effectiveness: percentage of women reporting no pregnancy after 1 yr of use

Hormonal Methods

Combined Oral Contraceptive Pills
- most contain low dose ethinyl estradiol (20-35 µg) plus progestin (norethindrone, norgestrel, levonorgestrel, desogestrel, norgestimate, drospirenone)
- failure rate (0.3% to 8%) depending on compliance
- monophasic or triphasic formulations (varying amount of progestin throughout cycle)

Transdermal (Ortho Evra®)
- continuous release of 6 mg norelgestromin and 0.60 mg ethinyl estradiol into bloodstream
- applied to lower abdomen, back, upper arm, buttocks NOT breast
- worn for 3 consecutive weeks (changed every wk) with 1 wk off to allow for menstruation
- as effective as OCP in preventing pregnancy (>99% with perfect use)
- may be less effective in women >90 kg
- may not be covered by drug plans

Contraceptive Ring (Nuva Ring®)
- thin flexible plastic ring; releases etonogestrel 120 µg/d and estradiol 15 µg/d
- works for 3 wk then removed for 1 wk to allow for menstruation
- as effective as OCP in preventing pregnancy (98%)
- side effects: vaginal infections/irritation, vaginal discharge
- may have better cycle control; i.e. decreased breakthrough bleeding

Starting Hormonal Contraceptives
- thorough history and physical exam, including blood pressure and breast exam
- can start at any time during cycle but ideal if within 5 d of LMP
- follow-up visit 6 wk after hormonal contraceptives prescribed
- pelvic exam not required as STI screening can be done by urine and pap smear screening does not start until >21 yr
Table 8. Combined Estrogen and Progestin Contraceptive Methods

<tbody>
<tr>
<td>Suitable for postpartum women (does not affect breast milk supply)/ Women with contraindications to combined OCP (e.g. thromboembolic or myocardial disease)/ Women intolerant of estrogenic side effects of combined OCPs</td>
<td>Progestin prevents LH surge/ Thickening of cervical mucus/ Decrease tubal mobility/ Endometrial decidualization/ Ovulation suppression – oral progestins (not IM) do not consistently suppress compared to combined OCPs</td>
<td>Irregular menstrual bleeding/ Weight gain/ Headache/ Breast tenderness/ Mood changes/ Functional ovarian cysts/ Acne/oyl skin/ Hirsutism</td>
<td>Absolute/ None</td>
</tr>
</tbody>
</table>

SELECTED EXAMPLES OF PROGESTIN-ONLY METHODS

Progestin-Only Pill ("minipill")

- Micronor® 0.35 mg norethindrone
- taken daily at same time of day to ensure reliable effect; no pill free interval
- higher failure rate (1.1–13% with typical use, 0.51% with perfect use) than other hormonal methods
- ovulation inhibited only in 60% of women; most have regular cycles (but may cause oligo/amenorrhea)
- highly effective if also post-partum breastfeeding, or if &gt;35 yr
- relies on the progestin effects on the cervical mucus and endometrial lining

Reference: World Health Organization Guidelines for Oral Contraceptive Pill Use

Depo-Provera®
- injectable depot medroxyprogesterone acetate
- dose 150 mg IM q12-14wk (convenient dosing)
- initiate ideally within 5 d of beginning of normal menses, immediately postpartum in breastfeeding and non-breastfeeding women. Can consider quick start
- irregular spotting progresses to complete amenorrhea in 70% of women (after 1-2 yr of use)
- highly effective 99%; failure rate 0.3%
- suppresses ovulation very effectively
- side effect: decreased bone density (may be reversible) and weight gain
- disadvantage: restoration of fertility may take up to 9 mo

**Intrauterine Device**

### Table 11. IUS/IUD Contraceptive Methods

<table>
<thead>
<tr>
<th>Mechanism of Action</th>
<th>Side Effects</th>
<th>Contraindications</th>
</tr>
</thead>
</table>
| Copper-Containing IUD (Nova T®): mild foreign body reaction in endometrium toxic to sperm and alters sperm motility | Both Copper and Progesterone IUD
Breakthrough bleeding
Expulsion (5% in the 1st yr, greatest in 1st mo and in nulliparous women)
Uterine wall perforation (1/1,000) on insertion | Absolutes
Both Copper and Progesterone IUD
Known or suspected pregnancy
Undiagnosed genital tract bleeding
Acute or chronic PID
Lifestyle risk for STIs®
Copper IUD
Known allergy to copper
Wilson’s disease |
| Progestrone-Releasing IUS (Mirena®, Kyleena®, Jaydess®): decidualization of endometrium and thickening of cervical mucus; minimal effect on ovulation | Copper IUD: increased blood loss and duration of menses, dysmenorrhea | Relative
Both Copper and Progesterone IUD
Valvular heart disease
Past history of PID or ectopic pregnancy
Presence of prosthesis
Abnormalities of uterine cavity, intracavitary fibroids
Cervical stenosis
Immunsuppressed individuals (e.g. HIV) |
| | Progesterone IUD: bloating, headache | Both Copper and Progesterone IUD
Known or suspected pregnancy
Undiagnosed genital tract bleeding
Acute or chronic PID
Lifestyle risk for STIs® |

* Cervical swabs for gonorrhea and chlamydia should be done prior to insertion

### Emergency Postcoital Contraception

### Table 12. Emergency Contraceptive Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Mechanism of Action</th>
<th>Side Effects</th>
<th>Contraindications</th>
</tr>
</thead>
</table>
| *Yuzpe Method*
Used within 72 h of unprotected intercourse; limited evidence of benefit up to 5 d
Ovral® 2 tablets then repeat in 12 h (ethinyl estradiol 100 µg/levonorgestrel 500 µg)
Can substitute with any OCP as long as same dose of estrogen used | Unknown; theories include: Suppresses ovulation or causes deficient luteal phase
Alters endometrium to prevent implantation
Affects sperm/ova transport | Nausea (due to estrogen; treat with Gravol®)
Irregular spotting
Pre-existing pregnancy (although not teratogenic)
Cautions in women with contraindications to OCP (although NO absolute contraindications) |
| *Plan B*
Consists of levonorgestrel 750 µg q12h for 2 doses (can also take 2 doses together); taken within 72 h of intercourse.
Can be taken up to 5 d
Greater efficacy (75-95%) if used within 24 h and better side effect profile than Yuzpe method but efficacy decreases with time; 1st line if >24 h
No estrogen thus very few contraindications/side effects (less nausea)
Less effective in overweight individuals (>75 kg less effective, >80 kg not recommended) | Same as above | Same as above but no caution in women with contraindications to OCP |
| *Uligilast*
30 mg PO within 5 d | Selective Progesterone Receptor Modulator (SPERM) with primarily antiprogestin activity; may delay ovulation by up to 5 d | Headache, hot flashes
Constipation, vertigo
Endometrial thickening | Same as above but no caution in women with contraindications to OCP |

**HORMONAL**

**NON-HORMONAL**

**Postcoital IUD (Copper)**
Insert up to 7 d postcoitus
Prevents implantation
1% failure rate
Can use for short duration in higher risk individuals
Minena® IUS cannot be used as EPC

---

Toronto Notes 2018
Follow-up
- 3-4 wk post treatment to confirm efficacy (confirmed by spontaneous menses or pregnancy test)
- contraception counselling

Termination of Pregnancy

Definition
- termination of pregnancy by medical or surgical means

Indications
- patient desires an end to pregnancy
- may be for medical reasons (mother or fetus unhealthy) or social reasons including patient request

Legal Issues
- no current law in Canada concerning abortion therefore considered legal at any gestational age
- CPSO: a physician must refer for abortion services regardless of personal beliefs but not compelled to perform procedure

Rates
- 24 induced abortions / 100 Live births in Canada (2010 data)
- worldwide: 42 million induced abortions per year; half are unsafe (WHO data)
  - maternal mortality almost zero where induced abortion is safe and legal; rises to 100 maternal deaths/100 000 live births in sub-Saharan Africa and other countries where abortion is illegal and unsafe
  - in Canada, 75% of induced abortions occur <16 weeks GA; very rare after 24 weeks (usually only for maternal/fetal reasons)

Methods of induced abortion
- medical
  - gold standard up to 9 weeks GA: mifepristone and misoprostol: 95-98% effective
  - Mifepristone blocks the progesterone receptor (progesterone required in early pregnancy)
  - Misoprostol induces uterine contractions
  - can also use misoprostol alone or methotrexate and misoprostol (with lower success rates of 90-95%)
  - side effects: bleeding (self-limited) and pain (while tissue passes) are expected side effects
- surgical
  - <14 wk:
    - manual vacuum aspiration – up to about 8-9 weeks with hand held aspiration device
    - suction dilatation + aspiration ± curettage may involve pre-surgical preparation of cervix with laminaria tents and/or misoprostol
  - 14-24 weeks: dilatation and evacuation; pre-surgical preparation of cervix required with laminaria tents
  - pain or discomfort during procedure mitigated by use of appropriate analgesia/sedation/anesthesia (including paracervical blocks)
  - rare complications (1-5%): laceration of cervix, infection/endometritis, retained products of conception, ongoing pregnancy
  - very rare complications: (0.1-2%): hemorrhage, perforation of uterus, Asherman's syndrome (adhesions within the endometrial cavity causing amenorrhea/infertility), future preterm birth (controversial and likely only with repeated abortion)
- counselling
  - options counselling always provided; always offer possibility of carrying pregnancy with/without adoption
  - offer future contraception and family planning services
  - ensure follow-up

There is no association between termination of pregnancy and either future breast cancer or future development of psychiatric disease.
Pregnancy-Related Complications

Spontaneous Abortions

- see Termination of Pregnancy for therapeutic abortions

Table 13. Classification of Spontaneous Abortions

</tbody>
</table>

Ectopic Pregnancy

Definition
- embryo implants outside of the endometrial cavity

Figure 14. Sites of ectopic pregnancy implantation
ampullary (70%) >> isthmal (12%) > fimbrial (11%) > ovarian (3%) > interstitial (2%) > abdominal (1%)

Epidemiology
- 1/100 pregnancies
- fourth leading cause of maternal mortality, leading cause of death in first trimester
- increase in incidence over the last 3 decades
- three commonest locations for ectopic pregnancy: ampullary (70%), isthmic (12%), fimbrial (11%)
Ectopic Pregnancy

Etiology
- 50% due to damage of fallopian tube cilia following PID
- intrinsic abnormality of the fertilized ovum
- conception late in cycle
- transmigration of fertilized ovum to contralateral tube

Risk Factors
- previous ectopic pregnancy
- gynecologic
  - current IUD use – increased risk of ectopic if pregnancy occurs
  - history of PID (especially infection with C. trachomatis), salpingitis
  - infertility
  - infertility treatment (IVF pregnancies following ovulation induction [7% ectopic rate])
  - previous procedures
  - any surgery on fallopian tube (for previous ectopic, tubal ligation, etc.)
  - abdominal surgery for ruptured appendix, etc.
- smoking
- structural
  - uterine leiomyomas
  - adhesions
  - abnormal uterine anatomy (e.g. T-shaped uterus)

Investigations
- serial β-hCG levels normal doubling time with intrauterine pregnancy is 1.6-2.4 d in early pregnancy
  - rise of <20% of β-hCG is 100% predictive of a non-viable pregnancy
  - prolonged doubling time, plateau, or decreasing levels before 8 wk implies nonviable gestation but does not provide information on location of implantation
  - 85% of ectopic pregnancies demonstrate abnormal β-hCG doubling
- ultrasound
  - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
  - specific finding on transvaginal U/S is a tubal ring
  - suspect ectopic in case of empty uterus by TVUS with β-hCG >2000-3000mIU/ml
- laparoscopy (sometimes used for definitive diagnosis)

Treatment
- goals of treatment: conservative (preserve tube if possible), maintain hemodynamic stability
- surgical = laparoscopy
  - linear salpingostomy an option if tube salvageable, however, patient must be reliable to follow-up with weekly β-hCG
  - salpingectomy if tube damaged or ectopic is ipsilateral recurrence
  - 15% risk of persistent trophoblast if salpingectomy; must monitor β-hCG titles weekly until they reach non-detectable levels
  - consider Rhogam® if Rh negative
  - may require laparotomy if patient is unstable, extensive abdominal surgical history, etc.

DDx of Lower Abdominal Pain
- Urinary tract: UTI, kidney stones
- GI: diverticulitis, appendicitis
- Gyn: endometriosis, PID, fibroid (degenerating, infarcted, torsion), ovarian torsion, ovarian neoplasm, ovarian cyst, pregnancy-related

Any woman presenting with abdominal pain, vaginal bleeding and amenorrhea is an ectopic pregnancy until proven otherwise

Figure 15. Algorithm for suspected ectopic pregnancy
• medical = methotrexate (for indications see Figure 4)
  ■ use 50 mg/m2 body surface area; given in a single IM dose
  ■ this is 1/5 to 1/6 chemotherapy dose, therefore minimal side effects (reversible hepatic dysfunction, diarrhea, gastritis, dermatitis)
  ■ follow β-hCG levels weekly until β-hCG is non-detectable
    • plateau or rising levels suggest persisting trophoblastic tissue (requires further treatment)
  ■ 82-95% success rate, but up to 25% will require a second dose
  ■ administer a second dose if β-hCG does not decrease by at least 15% between days 4 and 7
  ■ tubal patency following methotrexate treatment approaches 80%

**Prognosis**
• 9% of maternal deaths during pregnancy
• 40-60% of patients will become pregnant again after surgery
• 10-20% will have subsequent ectopic pregnancy

---

### Infertility

**Epidemiology**
• 10-15% of couples, must investigate both members of the couple

**Female Factors**

**Etiology**
• ovulatory dysfunction (15-20%)
  ■ hypothalamic (hypothalamic amenorrhea)
    • stress, poor nutrition, excessive exercise (even with presence of menstruation), history of eating disorders
  ■ pituitary (prolactinoma, hypopituitarism)
  ■ ovarian
    • PCOS
    • primary ovarian insufficiency
    • luteal phase defect (poor follicle production, premature corpus luteum failure, failed uterine lining response to progesterone), poorly understood
  ■ systemic diseases (thyroid, Cushing's syndrome, renal/hepatic failure), diabetes
  ■ congenital anomalies (Turner's syndrome, gonadal dysgenesis or gonadotropin deficiency)
• outflow tract abnormality (15-20%)
  ■ tubal factors (20-30%)
    • PID
    • adhesions (previous surgery, peritonitis, endometriosis)
    • ligation/occlusion (e.g. previous ectopic pregnancy)
  ■ uterine factors (<5%)
  ■ cervical factors (5%)
    ■ hostile or acidic cervical mucus, anti-sperm antibodies
    ■ structural defects (cone biopsies, laser or cryotherapy)
• endometriosis (15-30%)
• multiple factors (30%)
• unknown factors (10-15%)

**Investigations**
• ovulatory
  • day 3: FSH, LH, TSH, prolactin ± DHEA free testosterone (if hirsute) add estradiol for proper FSH interpretation
  • day 21-23: serum progesterone to confirm ovulation
  • initiate basal body temperature monitoring (biphasic pattern)
  • postcoital test: evaluate mucus for clarity, pH, spinnbarkeit/fibrosity (rarely done)
• tubal factors
  ■ HSG (can be therapeutic – opens fallopian tube)
  ■ SHG (can be therapeutic; likely less – opens fallopian tube)
  ■ laparoscopy with dye insufflation (or tubal dye test) rarely done as diagnostic
  ■ peritoneal/uterine factors
  ■ HSG/SHG, hysteroscopy
• other
  ■ karyotype

---

### Contraindications to Methotrexate Therapy for Ectopic Pregnancy
• Abnormalities in hematologic, hepatic or renal function
• Immune deficiency
• Active pulmonary disease
• Peptic ulcer disease
• Hypersensitivity to methotrexate
• Heterotopic pregnancy with coexisting viable intrauterine pregnancy
• Breastfeeding
• Unwilling or unable to adhere to methotrexate protocol

### When Should Investigations Begin?
• <35 yr: after 1 yr of regular unprotected intercourse
• 35-40 yr: after >6 mo
• >40 yr: immediately
• Earlier if
  • History of PID
  • History of infertility in previous relationship
  • Prior pelvic surgery
  • Chemotherapy/rad ation in either partner
  • Recurrent pregnancy loss
  • Moderate severe endometriosis

### Controversial and Evolving Ethical Issues
• Infertility demands non-judgmental discussion
• Ethical issues surrounding therapeutic donor insemination in same sex couples, surrogacy, donor gametes, and other advanced reproductive technologies are still evolving and remain controversial
• If the doctor finds that certain treatment options lie outside of their moral boundaries, the infertile couple should be referred to another physician
Polycystic Ovarian Syndrome

**Etiology**
- varicocele (>40%)
- idiopathic (>20%)
- obstruction (~15%)
- cryptoorchidism (~8%)
- immunologic (~3%)

**Investigations**
- semen analysis and culture
- postcoital (Huhner) test: rarely done

**Male Factors**
- see Urology, U34

**Treatment**
- education: timing intercourse relative to ovulation (from 2 d prior to 2 d following presumed ovulation), every other day
- medical
  - ovulation induction
    - clomiphene citrate (Clomid®): estrogen antagonist causing a perceived decreased estrogen state, resulting in increased pituitary gonadotropins; which increases FSH and LH and induces ovulation (better results if anovulatory)
  - followed by β-hCG for stimulation of ovum release
  - Letrozole: aromatase inhibitor. May be associated with a higher rate of live births in patients with PCOS
  - may add
    - bromocriptine (dopamine agonist) if elevated prolactin
    - dexamethasone for hyperandrogenism (adult onset congenital adrenal hyperplasia)
    - metformin (for PCOS)
  - luteal phase progesterone supplementation for luteal phase defect (mechanism not completely understood)
  - anticoagulation and ASA (81 mg PO OD) for women with a history of recurrent spontaneous abortions (for antiphospholipid antibody syndrome)
  - thyroid replacement to keep TSH <2.5
- surgical/procedural
  - tubuloplasty
  - lysis of adhesions
  - artificial insemination: intracervical insemination (ICI), intrauterine insemination (IUI), intratubal insemination (ITI)
  - sperm washing
  - IVP (in vitro fertilization)
  - IFT (intrafallopian transfer)
    - GIFT® (gamete intrafallopian transfer): immediate transfer with sperm after oocyte retrieval
    - ZIFT® (zygote intrafallopian transfer): transfer after 24 h culture of oocyte and sperm
    - TET* (tubal embryo transfer): transfer after >24 h culture
    - ICSI (intracytoplasmic sperm injection)
    - IVM (in vitro maturation)
    - ± oocyte or sperm donors
- ± pre-genetic screening for single gene defects in karyotype of zygote

*not performed in Canada

**Polycystic Ovarian Syndrome**
- also called chronic ovarian androgenism

**Etiology**
- polycystic ovarian syndrome – HAIR-AN
  - Hirsutism
  - Hyperandrogenism
  - Infertility
  - Insulin Resistance
  - Acanthosis Nigricans

**Insulin**
- ↑ estrogen
  - ↓ FSH secretion + ↑ LH secretion
  - ↓ Anovulation
  - ↑ peripheral conversion to estrogen
  - ↓ ovarian secretion of androgens
  - ↓ Oligomenorrhea
  - ↓ Hirsutism
  - ↓ Infertility

*Figure 16. Pathophysiology of polycystic ovarian syndrome*
Polycystic Ovarian Syndrome

Diagnosis
- Rotterdam diagnostic criteria: 2 of 3 required
  - oligomenorrhea/irregular menses for 6 mo
  - hyperandrogenism
    - clinical evidence - hirsutism or acne or
    - biochemical evidence - raised free testosterone
  - polycystic ovaries on U/S (not appropriate in adolescents)

Clinical Features
- average age 15-35 yr at presentation
- in adolescents, wait at least 1-2 yr to make diagnosis as adolescence resembles PCOS
- abnormal/irregular uterine bleeding, hirsutism, infertility, obesity, virilization
- acanthosis nigricans: browning of skin folds in intertriginous zones (indicative of insulin resistance)
- insulin resistance occurs in both lean and obese patients
- family history of DM

Investigations
- goal: identify hyperandrogenism or chronic anovulation; and rule out specific pituitary or adrenal disease as the cause
- laboratory
  - prolactin, 17-hydroxyprogesterone, free testosterone, DHEA-S, TSH, free T4, androstenedione, SHBG
  - LH:FSH >2:1; LH is chronically high with FSH mid-range or low (low sensitivity and specificity)
  - increased DHEA-S, androstenedione and free testosterone (most sensitive), decreased SHBG
  - transvaginal or transabdominal U/S: polycystic-appearing ovaries ("string of pearls" – 12 or more small follicles 2-9 mm, or increased ovarian volume)
  - tests for insulin resistance or glucose tolerance
    - fasting glucose:insulin ratio <4.5 is consistent with insulin resistance (U.S. units)
    - 75 g OGTT yearly (particularly if obese)
- laparoscopy
  - not required for diagnosis
  - most common to see white, smooth, sclerotic ovaries with a thick capsule; multiple follicular cysts in various stages of atresia; hyperplastic theca and stroma
- rule out other causes of abnormal bleeding

Treatment
- cycle control
  - lifestyle modification (decrease BMI, increase exercise) to decrease peripheral estrone formation
  - OCP monthly or cyclic Provera* to prevent endometrial hyperplasia due to unopposed estrogen
  - oral hypoglycemic (e.g. metformin) if type 2 diabetic or if trying to become pregnant
  - tranexamic acid (Cyklokapron*) for menorrhagia only
  - infertility
    - medical induction of ovulation: clomiphene citrate, letrozole, human menopausal gonadotropins (HMG [Pergonal®]), LHRH, recombinant FSH, and metformin
    - metformin may be used alone or in conjunction with clomiphene citrate for ovulation induction
    - ovarian drilling (perforate the stroma), wedge resection of the ovary
    - bromocriptine (if hyperprolactinemia)
  - hirsutism
    - any OCP can be used
      - Diane 35* (cyproterone acetate): antiandrogenic
      - Yasmin* (drospirenone and ethinyl estradiol): spironolactone analogue (inhibits steroid receptors)
    - mechanical removal of hair
    - finasteride (5-a reductase inhibitor)
    - flutamide (androgen reuptake inhibitor)
    - spironolactone: androgen receptor inhibitor

Conclusions
- Metformin increases the likelihood of ovulation (OR 4.39, 95% CI 1.45-9.40). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS. Furthermore, the combination therapy had a higher likelihood of having a live birth compared to clomiphene alone, but this did not reach significance (OR 1.74, 95% CI 0.79-3.86).

Results
- 1,639 patients with PCOS were followed up for up to 12 mo.
- Compared to placebo, metformin increased the odds of ovulation (OR 2.94, 95% CI 1.43-6.02). However, when used alone, metformin did not significantly increase the odds of achieving pregnancy (OR 1.36, 95% CI 0.74-2.33). When compared to clomiphene alone, the combination of metformin and clomiphene increased the likelihood of ovulation (OR 4.39, 95% CI 1.94-9.56) and pregnancy (OR 2.67, 95% CI 1.45-4.94). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS.
- Metformin increases the likelihood of ovulation and pregnancy, especially in clomiphene-resistant and obese women.

Use of Metformin in Polycystic Ovary Syndrome: A Meta-Analysis
- Obstet Gynecol 2000;111(4):859-68
- Study: This meta-analysis of 17 RCTs assessed the efficacy of metformin or metformin in combination with clomiphene citrate in women with PCOS who were seeking pregnancy.
- Main Outcomes: Ovulation, pregnancy, and live birth. Patients: 1,639 patients with PCOS were followed up for up to 12 mo.
- Results: Compared to placebo, metformin increased the odds of ovulation (OR 2.94, 95% CI 1.43-6.02). However, when used alone, metformin did not significantly increase the odds of achieving pregnancy (OR 1.36, 95% CI 0.74-2.33). When compared to clomiphene alone, the combination of metformin and clomiphene increased the likelihood of ovulation (OR 4.39, 95% CI 1.94-9.56) and pregnancy (OR 2.67, 95% CI 1.45-4.94). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS. Furthermore, the combination therapy had a higher likelihood of having a live birth compared to clomiphene alone, but this did not reach significance (OR 1.74, 95% CI 0.79-3.86).
- Conclusions: Metformin increases the likelihood of ovulation and pregnancy. When used together with clomiphene, metformin increases the likelihood of both ovulation and pregnancy, especially in clomiphene-resistant and obese women.
Gynecological Infections

Physiologic Discharge

- clear, white, flocculent, odourless discharge; pH 3.8–4.2
- smear contains epithelial cells, Lactobacilli
- increases with increased estrogen states: pregnancy, OCP, mid-cycle, PCOS, or premenarchal
- if increased in perimenopausal/postmenopausal woman, consider investigation for other effects of excess estrogen (e.g. endometrial cancer)

Vulvovaginitis

PREPUBERTAL VULVOVAGINITIS

- clinical features
  - irritation, pruritus
  - discharge
  - vulvar erythema
  - vaginal bleeding (specifically due to Group A Streptococci and Shigella)
- differential diagnosis
  - non-specific vulvovaginitis (25–75%)
  - infections (respiratory, enteric, systemic, sexually acquired)
  - foreign body (toilet paper most common)
  - Candida (if using diapers, chronic antibiotics or chronically immunosuppressed)
  - pinworms
  - polyps, tumour (ovarian malignancy)
  - vulvar skin disease (lichen sclerosis, condyloma acuminata)
  - trauma (accidental straddle injury, sexual abuse)
  - psychosomatic vaginal complaints (specific to vaginal discharge)
  - endocrine abnormalities (specific to vaginal bleeding)
  - blood dyscrasia (specific to vaginal bleeding)
- etiology
  - infectious:
    - poor hygiene, proximity of vagina to anus
    - recent infection (respiratory, enteric, systemic)
    - STI: investigate sexual abuse
  - non-specific:
    - lack of protective hair and labial fat pads
    - lack of estrogenization
    - susceptible to chemicals, soaps (bubble baths), medications, and clothing
    - enuresis
- investigations
  - vaginal swab for culture (specifically state that it is a pre-pubertal specimen)
  - pH, wet-mount, and KOH smear in adults only
- treatment
  - enhanced hygiene and local measures (handwashing, white cotton underwear, no nylon tights, no
    tight fitting clothes, no sleeper pajamas, sitz baths, avoid bubble baths, use mild detergent, eliminate
    fabric softener, avoid prolonged exposure to wet bathing suits, urination with legs spread apart)
  - A&D® dermatological ointment (vitamin A/D) to protect vulvar skin
  - infectious: treat with antibiotics for organism identified

Sexually Transmitted Infections

- see Family Medicine, FM42
TRICHOMONIASIS
• see Infectious Vulvovaginitis, Table 15

CHLAMYDIA

Etiology
• Chlamydia trachomatis

Epidemiology
• most common bacterial STI in Canada
• often associated with N. gonorrhoeae

Clinical Features
• asymptomatic (80% of women)
• muco-purulent endocervical discharge
• urethral syndrome: dysuria, frequency, pyuria, no bacteria on culture
• pelvic pain
• postcoital bleeding or intermenstrual bleeding (particularly if on OCP and prior history of good cycle control)
• symptomatic sexual partner

Investigations
• cervical culture or nucleic acid amplification test
• obligate intracellular parasite: tissue culture is the definitive standard
• urine and self vaginal tests now available which are equally or more effective than cervical culture

Treatment
• doxycycline 100 mg PO bid for 7 d or azithromycin 1 g PO in a single dose (may use in pregnancy)
• also treat gonorrhea because of high rate of co-infection
• treat partners
• reportable disease
• test of cure for chlamydia required in pregnancy (cure rates lower in pregnant patients) → retest 3-4 wk after initiation of therapy

Screening
• high risk groups
• during pregnancy
• when initiating OCP if sexually active (independent risk factor)

Complications
• PID – low grade salpingitis and adhesions resulting in tubal obstruction
• infertility
• ectopic pregnancy
• chronic pelvic pain
• Fitz-Hugh-Curtis syndrome (liver capsule inflammation)
• reactive arthritis (male predominance, HLA-B27 associated), conjunctivitis, urethritis
• perinatal infection: conjunctivitis, pneumonia

GONORRHEA

Etiology
• Neisseria gonorrhoeae
• symptoms and risk factors same as with chlamydia

Investigations
• Gram stain shows Gram-negative intracellular diplococci
• cervical, rectal, and throat culture (if clinically indicated)

Treatment
• single dose of ceftriaxone 250 mg IM plus azithromycin 1 g PO
• if pregnant: above regimen or 2 g spectinomycin IM plus azithromycin 1 g PO (avoid quinolones)
• also treat chlamydia, because of high rate of co-infection
• treat partners
• reportable disease
• screening as with chlamydia
HUMAN PAPILLOMAVIRUS

Etiology
- most common viral STI in Canada
- >200 subtypes, of which >30 are genital subtypes
- HPV types 6 and 11 are classically associated with anogenital warts/condylomata acuminata
- HPV types 16 and 18 are the most oncogenic (classically associated with cervical HSIL)
- types 16, 18, 31, 33, 35, 36, 45 (and others) associated with increased incidence of cervical and vulvar intraepithelial hyperplasia and carcinoma

Clinical Features
- latent infection
  - no visible lesions, asymptomatic
  - only detected by DNA hybridization tests
- subclinical infection
  - visible lesion found during colposcopy or on Pap test
- clinical infection
  - visible wart-like lesion without magnification
  - hyperkeratotic, verrucous or flat, macular lesions
  - vulvar edema

Investigations
- cytology
- koilocytosis: nuclear enlargement and atypia with perinuclear halo
- biopsy of lesions at colposcopy
- detection of HPV DNA subtype using nucleic acid probes (not routinely done but can be done in presence of abnormal Pap test to guide treatment)

Treatment
- patient administered
  - podofilox 0.5% solution or gel bid x 3 d in a row (4 d off) then repeat x 4 wk
  - imiquimod (Aldara*) 5% cream 3x/wk qhs x 16 wk
- provider administered
  - cryotherapy with liquid nitrogen: repeat q1-2wk
  - podophyllin resin in tincture of benzoin: weekly
  - trichloroacetic acid (TCA) (80-90%) or bichloroacetic acid weekly X4-6wks; safe in pregnancy
  - surgical removal/laser
  - intralesional interferon

Prevention
- vaccination: Gardasil® 9, Gardasil®, Cervarix® see Table 25, GY43
- condoms may not fully protect (areas not covered, must be used every time throughout entire sexual act)

HERPES SIMPLEX VIRUS OF VULVA

Etiology
- 90% are HSV-2, 10% are HSV-1

Clinical Features
- may be asymptomatic
- initial symptoms: present 2-21 d after contact
- prodromal symptoms: tingling, burning, pruritus
- multiple painful, shallow ulcerations with small vesicles appear 7-10 d after initial infection (absent in many infected persons); lesions are infectious
- inguinal lymphadenopathy, malaise, and fever often with first infection
- dysuria and urinary retention if urethral mucosa affected
- recurrent infections: less severe, less frequent and shorter in duration (usually only HSV-2)

Investigations
- viral culture preferred in patients with ulcer present, however decreased sensitivity as lesions heal
- cytologic smear (Tzanck smear) shows multinucleated giant cells, acidophilic intranuclear inclusion bodies
- HSV DNA PCR
- type specific serologic tests for antibodies to HSV-1 and HSV-2 (not available routinely in Canada)
Treatment
• first episode
  - acyclovir 400 mg PO tid x 7-10 d or acyclovir 200 mg PO five times daily x 7-10 d or valacyclovir 1g PO bid x 7-10 d or famciclovir 250 mg PO tid x 7-10 d
• recurrent episode
  - acyclovir 400 mg PO tid x 5 d or acyclovir 800 mg PO bid x 5 d or acyclovir 800 mg PO tid x 2 d or valacyclovir 500 mg PO bid x 3 d or valacyclovir 1 g PO OD x 5 d or famciclovir 125 mg PO bid x 5 d or famciclovir 1 g PO bid x 1 d or famciclovir 500 mg PO x 1 d followed by 250 mg PO bid x 2 d
• daily suppressive therapy
  - consider for >6 recurrences per yr or one every 2 mo
  - acyclovir 400 mg PO bid or valacyclovir 500 mg PO OD or valacyclovir 1 g PO OD or famciclovir 250 mg PO bid
  - severe disease: IV acyclovir 5-10 mg/kg IV q8h x 2-7 d or until clinical improvement observed followed by oral antiviral therapy to complete 10 d of therapy total
  - education regarding transmission
  - avoid contact from onset of prodrome until lesions have cleared
  - use barrier contraception

SYPHILIS
Etiology
• Treponema pallidum

Classifications
• primary syphilis
  - 3-4 wk after exposure
  - painless chancre on vulva, vagina, or cervix
  - painless inguinal lymphadenopathy
  - serological tests usually negative, local infection only
• secondary syphilis (can resolve spontaneously)
  - 2-6 mo after initial infection
  - nonspecific symptoms: malaise, anorexia, headache, diffuse lymphadenopathy
  - generalized maculopapular rash: palms, soles, trunk, limbs
  - condylomata lata: anogenital, broad-based fleshy grey lesions
  - serological tests usually positive
• latent syphilis
  - no clinical manifestations; detected by serology only
• tertiary syphilis
  - may involve any organ system
  - neurological: tabes dorsalis, general paresis
  - cardiovascular: aortic aneurysm, dilated aortic root
  - vulvar gumma: nodules that enlarge, ulcerate and become necrotic (rare)
• congenital syphilis
  - may cause fetal anomalies, stillbirths, or neonatal death

Investigations
• aspiration of ulcer serum or node
• darkfield microscopy (most sensitive and specific diagnostic test for syphilis)
• spirochetes
• non-treponemal screening tests (VDRL, RPR); non-reactive after treatment, can be positive with other conditions
• specific anti treponemal antibody tests (FTA-ABS, MHA-TP, TP-PA)
  - confirmatory tests; remain reactive for life (even after adequate treatment)

Treatment
• treat partners
• reportable disease
• treatment of primary, secondary, latent syphilis of <1 yr duration
  - benzathine penicillin G 2.4 million units IM single dose
• treatment of latent syphilis of >1 yr duration
  - benzathine penicillin G 2.4 million units IM q1wk x 3 wk
• treatment of neurosyphilis
  - IV aqueous penicillin G 3-4 million units IM q4h x 10-14 d
• screening
  - high risk groups
  - in pregnancy (see Obstetrics, Table Infections During Pregnancy, OB29)

Complications
• if untreated, 1/3 will experience late complications

HIV
• see Infectious Diseases, ID27
Bartholin Gland Abscess

**Etiology**
- often anaerobic and polymicrobial
- *U. urealyticum*, *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, *P. mirabilis*, *Streptococcus* spp., *S. aureus* (rare)
- blockage of duct

**Clinical Features**
- unilateral swelling and pain in inferior lateral opening of vagina
- sitting and walking may become difficult and/or painful

**Treatment**
- sitz baths, warm compresses
- antibiotics: cephalexin x 1 wk
- incision and drainage using local anesthesia with placement of Word catheter (10 French latex catheter) for 2-3 wk (or as long as stays in situ)
- marsupialization under general anesthetic – more definitive treatment
- rarely treated by removing gland

Pelvic Inflammatory Disease

**Etiology**
- causative organisms (in order of frequency)
  - *C. trachomatis*
  - *N. gonorrhoeae*
    - gonorrhea and chlamydia often co-exist
  - endogenous flora: anaerobic, aerobic, or both
    - *E. coli*, *Staphylococcus*, *Streptococcus*, *Enterococcus*, *Bacteroides*, *Peptostreptococcus*, *H. influenzae*, *G. vaginalis*
  - cause of recurrent PID
  - associated with instrumentation
  - *Actinomyces israelii* (Gram-positive, non acid-fast anaerobe)
    - 1-4% of PID cases associated with IUDs
    - others (TB, Gram-negatives, CMV, *U. urealyticum*, etc.)

**Risk Factors**
- age <30 yr
- risk factors as for chlamydia and gonorrhea
- vaginal douching
- IUD (within first 10 d after insertion)
- invasive gynecologic procedures (D&C, endometrial biopsy)

**Clinical Presentation**
- up to 2/3 asymptomatic: many subtle or mild symptoms
- common: fever >38.3°C, lower abdominal pain and tenderness, abnormal discharge: cervical or vaginal
- uncommon: N/V, dysuria, AUB
- chronic disease (often due to chlamydia)
  - constant pelvic pain
  - dyspareunia
  - palpable mass
  - very difficult to treat, may require surgery

**Investigations**
- blood work
  - β-hCG (must rule out ectopic pregnancy), CBC, blood cultures if suspect septicemia
- urine R&M
- speculum exam, bimanual exam
  - vaginal swab for Gram stain, C&S
  - cervical cultures for *N. gonorrhoeae*, *C. trachomatis*
  - endometrial biopsy will give definitive diagnosis (rarely done)
- ultrasound
  - may be normal
  - free fluid in cul-de-sac
  - pelvic or tubo-ovarian abscess
  - hydrocolpos (dilated fallopian tube)
- laparoscopy (gold standard)
  - for definitive diagnosis: may miss subtle inflammation of tubes or endometritis

**PID Diagnosis**
- Must have
  - Lower abdominal pain
  - Plus one of
    - Cervical motion tenderness
    - Adnexa tenderness
  - Plus one or more of
    - High risk partner
    - Temperature >38°C
    - Mucopurulent cervical discharge
    - Positive culture for *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, or other vaginal flora
    - Cul-de-sac fluid, pelvic abscess or inflammatory mass on U/S or bimanual
    - Leukocytosis
    - Elevated ESR or CRP (not commonly used)
Treatment

- must treat with polymicrobial coverage
- inpatient if:
  - moderate to severe illness
  - atypical infection
  - adnexal mass, tubo-ovarian mass, or pelvic abscess
  - unable to tolerate oral antibiotics or failed oral therapy
  - immunocompromised
  - pregnant
  - adolescent – first episode
  - surgical emergency cannot be excluded (e.g. ovarian torsion)
  - PID is secondary to instrumentation
  - recommended treatment
    - Regimen A: cefoxitin 2 g IV q6h PLUS doxycycline 100 mg IV/PO q12h
    - Regimen B: clindamycin 900 mg IV q8h PLUS gentamicin loading dose 2 mg/kg IV/IM followed by 1.5 mg/kg IV/IM q8h
    - continue IV antibiotics for 24 h after symptoms have improved then doxycycline 100 mg PO bid to complete 14 d
    - percutaneous drainage of abscess under U/S guidance
    - when no response to treatment, laparoscopic drainage
    - if failure, treatment is surgical (salpingectomy, TAH/BSO)
- outpatient if:
  - typical findings
  - mild to moderate illness
  - oral antibiotics tolerated
  - compliance ensured
  - follow-up within 48-72 h (to ensure symptoms not worsening)
  - recommended treatment (Regimen A OR Regimen B)
    - Regimen A, 1 of:
      - ceftriaxone 250 mg IM x 1 PLUS doxycycline 100 mg PO bid x 14 d ± metronidazole 500 mg PO bid x 14 d
      - cefoxitin 2 g IM PLUS probenecid 1 g PO x 1 PLUS doxycycline 100 mg PO bid x 14 d ± metronidazole 500 mg PO bid x 14 d
    - Regimen B, 1 of:
      - ofloxacin 400 mg PO bid x 14 d ± metronidazole 500 mg PO bid x 14 d
      - levofloxacin 500 mg PO bid OD x 14 d ± metronidazole 500 mg PO BI bid D x 14 d
  - consider removing IUD after a minimum of 24 h of treatment
  - reportable disease
  - treat partners
  - consider re-testing for C. trachomatis and N. gonorrhoeae 4-6 wk after treatment if documented infection

Complications of Untreated PID

- chronic pelvic pain
- abscess, peritonitis
- adhesion formation
- ectopic pregnancy
- infertility
  - 1 episode of PID → 13% infertility
  - 2 episodes of PID → 36% infertility
- bacteremia
- septic arthritis, endocarditis

Toxic Shock Syndrome

[see Infectious Diseases, ID23]

Risk Factors

- tampon use
- diaphragm, cervical cap, or sponge use (prolonged use, i.e. >24 h)
- wound infections
- post-partum infections
- early recognition and treatment of syndrome is imperative as incorrect diagnosis can be fatal

Clinical Presentation

- sudden high fever
- sore throat, headache, diarrhea
- erythroderma
- signs of multisystem organ failure
- refractory hypotension
- exfoliation of palmar and plantar surfaces of the hands and feet 1-2 wk after onset of illness
Sexual Abuse

Treatment
- remove potential sources of infection (foreign objects and wound debris)
- debride necrotic tissues
- adequate hydration
- penicillinase-resistant antibiotics, e.g. cloxacillin
- steroid use controversial but if started within 72 h, may reduce severity of symptoms and duration of fever

Surgical Infections

Post-Operative Infections in Gynecological Surgery
- pelvic cellulitis
  - common post hysterectomy, affects vaginal vault
  - erythema, induration, tenderness, discharge involving vaginal cuff
  - treat if fever and leukocytosis with broad spectrum antibiotics, i.e. clindamycin and gentamicin
  - drain if excessive purulence or large mass
  - can result in intra-abdominal and pelvic abscess
- see General Surgery, Post-Operative Fever, GS7

Sexual Abuse

- see Family Medicine, FM26, Emergency Medicine, ER27

Sexuality and Sexual Dysfunction

SEXUAL RESPONSE
1. desire: energy that allows an individual to initiate or respond to sexual stimulation
2. arousal: physical and emotional stimulation leading to breast and genital vasodilation and clitoral engorgement
3. orgasm: physical and emotional stimulation is maximized, allowing the individual to relinquish their sense of control
4. resolution: most of the congestion and tension resolves within seconds, complete resolution may take up to 60 min

SEXUAL DYSFUNCTION

Etiology
- psychological or emotional: depression, abuse
- hormonal: menopause
- neurologic dysfunction: spinal cord injury
- vascular insufficiency: DM
- drug side effects: β-blockers
- trauma: episiotomy

Classification
- lack of desire (60-70% of women)
- lack of arousal
- anorgasmia (5-10%)
  - primary anorgasmia: never before achieved orgasm under any circumstances
  - secondary anorgasmia: was able to achieve orgasms before but now unable to
- dyspareunia (3-6%): painful intercourse, superficial or deep
  - vaginismus (15%)
  - vulvodynia
  - vaginal atrophy
  - vulvar vestibulitis: associated with history of frequent yeast infections
  - PID

Treatment
- lack of desire: assess factors, rule out organic causes, relationship therapy, sensate focus exercises
- anorgasmia: self-exploration/pleasuring, relationship therapy if needed, bridging techniques (different sexual positions, clitoral stimulation during intercourse)
- dyspareunia
  - Kegel and reverse Kegel exercises
  - dilator treatment
  - comfort with self-exam
  - psychotherapy, other behavioural techniques
  - female on top position: allows for control of speed and duration
  - vestibulitis: remove local irritants, change in contraceptive methods, dietary changes (increased citrate, decreased oxalate), and vestibulectomy (rare)
  - vulvodynia: local moisturization, cold compresses, systemic nerve blocking therapy (amitriptyline, gabapentin) orally or topically, topical anesthetics, estrogen cream
  - pain clinic
  - removal of environmental factors – bubble baths, soaps, perfumes, sanitary pads with plastic lining

Kegel Exercises
- Regular contraction and relaxation to strengthen pelvic floor muscles
- Reverse Kegel Exercises
  - 1 s contraction then 5 s of relaxation
Menopause

• see Family Medicine, FM40

Definitions

• lack of menses for 1 yr

• types of menopause
  • physiological; average age 51 yr (follicular atresia)
  • primary ovarian insufficiency; before age 40 (autoimmune disorder, infection, Turner’s syndrome)
  • iatrogenic (surgical/radiation/chemotherapy)

Clinical Features

• associated with estrogen deficiency
  • vasomotor instability (tends to dissipate with time)
    • hot flushes/flashes, night sweats, sleep disturbances, formication, nausea, palpitations
  • urogenital atrophy involving vagina, urethra, bladder
    • dyspareunia, pruritus, vaginal dryness, bleeding, post-coital bleeding, urinary frequency, urgency, incontinence
    • inspection may reveal: thinning of tissues, erythema, petechiae, bleeding points, dryness on speculum exam
  • skeletal
    • osteoporosis, joint and muscle pain, back pain
  • skin and soft tissue
    • decreased breast size, skin thinning/loss of elasticity
  • psychological
    • mood disturbance, irritability, fatigue, decreased libido, memory loss

Investigations

• increased levels of FSH (>35 IU/L) on day 3 of cycle (if still cycling) and LH (FSH>LH)
• FSH level not always predictive due to monthly variation; use absence of menses for 1 yr to diagnose
• decreased levels of estradiol (later)

Treatment

• goal is for individual symptom management
  • vasomotor instability
    • HRT (first line), SSRIs, venlafaxine, gabapentin, propranolol, clonidine
  • acupuncture
  • vaginal atrophy
    • local estrogen: cream (Premarin*), vaginal suppository (VagiFem*), ring (Estring*)
    • lubricants (Replens*)
    • oral or transdermal hormone replacement therapy (if treatment for systemic symptoms is desired)
    • intravaginal laser
  • urogenital health
    • lifestyle changes (weight loss, bladder re-training), local estrogen replacement, surgery
  • osteoporosis
    • 1,000-1,500 mg calcium OD, 800-1,000 IU vitamin D, weight-bearing exercise, smoking cessation
    • bisphosphonates (e.g. alendronate)
    • selective estrogen receptor modifiers (SERMs): raloxifene (Evista*) – mimics estrogen effects on bone, avoids estrogen-like action on breast and uterine cancer; does not help hot flashes
    • HRT: second-line treatment (unless for vasomotor instability as well)
  • decreased libido
    • vaginal lubrication, counselling, androgen replacement (testosterone cream or the oral form Androli*)
  • cardiovascular disease
    • management of cardiovascular risk factors
  • mood and memory
    • antidepressants (first line), HRT (augments effect)
  • alternative choices (not evidence-based, safety not established)
    • black cohosh, phytoestrogens, St. John’s wort, gingko biloba, valerian, evening primrose oil, ginseng, Don Quai

Menopause

Occurrence of last spontaneous menstrual period, resulting from loss of ovarian function (loss of oocyte response to gonadotropins)

“Being in menopause”
Lack of menses for 1 yr

Perimenopause
Period of time surrounding menopause (2-8 yr preceding + 1 yr after last menses) characterized by fluctuating hormone levels, irregular menstrual cycles, and symptom onset

• 85% of women experience hot flashes
• 20-30% seek medical attention
• 10% are unable to work

Menopause Pathophysiology

Degenerating theca cells fail to react to endogenous gonadotropins (FSH, LH)

Less estrogen is produced

Decreased negative feedback on hypothalamic-pituitary-adrenal axis

Increased FSH and LH

Stromal cells continue to produce androgens as a result of increased LH stimulation

Osteoporosis is the single most important health hazard associated with menopause

Cardiovascular disease is the leading cause of death post-menopause

Increased risk of breast cancer (RR 1.3) is associated with estrogen+progesterone HRT, but not with estrogen-only HRT

All women taking HRT should have periodic surveillance and counselling regarding its benefits and risks
Hormone Replacement Therapy

- see Family Medicine, FM40
- primary indication is treatment of menopausal symptoms (vasomotor instability)
- keep doses low (e.g. 0.3 mg Premarin\textsuperscript{®}) and duration of treatment short (<5 yr)

HRT Components

- estrogen
- oral or transdermal (e.g. patch, gel)
- transdermal preferred for women overall, especially with hypertriglyceridemia or impaired hepatic function, smokers, and women who suffer from headaches associated with oral HRT
- low-dose (preferred dose: 0.3 mg Premarin\textsuperscript{®}/25 µg Estradot\textsuperscript{®} patch, can increase if necessary)
- progestin
- given in combination with estrogen for women with an intact uterus to prevent development of endometrial hyperplasia/cancer

Table 16. Examples of HRT Regimens

<table>
<thead>
<tr>
<th>HRT Regimen</th>
<th>Estrogen Dose</th>
<th>Progestin Dose</th>
<th>Notes</th>

<tr>
<td>Standard-Dose</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA 2.5 mg PO OD, or micronized progestrone 100 mg PO OD</td>
<td>Withdrawal bleeding may occur in a spotty, unpredictable manner Usually abates after 6-8 mo due to endometrial atrophy Once patient has become amenorrheic on HRT, significant subsequent bleeding episodes require evaluation (endometrial biopsy)</td>
</tr>
<tr>
<td>Standard-Dose</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA 5-10 mg PO days 1-14 only, or micronized progestrone 200 mg PO OD days 1-14 only</td>
<td>Bleeding occurs monthly after day 14 of progestin (can continue for years) PMS-like symptoms (breast tenderness, fluid retention, headache, nausea) are more prominent with cyclic HRT</td>
</tr>
<tr>
<td>Cyclic</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA low-dose</td>
<td>3 d on, 3 d off</td>
</tr>
<tr>
<td>Pulsatile</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA low-dose</td>
<td>Use patch twice weekly Can use oral progestins (Estrodern\textsuperscript{®}) Combined patches available (Estalis\textsuperscript{®})</td>
</tr>
<tr>
<td>Transdermal</td>
<td>Estrodern\textsuperscript{®}-Estradiol 0.05 mg/d or 0.1 mg/d Estalis\textsuperscript{®}-Estradiol 140 µg/d or 250 µg/d</td>
<td>Estrodern\textsuperscript{®}-MPA 2.5 mg PO OD Estalis\textsuperscript{®} NEA 50 µg/d</td>
<td>Use patch twice weekly Can use oral progestins (Estrodern\textsuperscript{®}) Combined patches available (Estalis\textsuperscript{®})</td>
</tr>
<tr>
<td>Topical</td>
<td>Estrace\textsuperscript{®} 2-4 g/d x 1-2 wk, 1 g/d maintenance Premarin\textsuperscript{®} 0.5-2 g/d for 21 d then off 7 d for vaginal atrophy, 0.5 g/d for 21 d then off 7 d or twice/wk for dyspareunia Estragyn\textsuperscript{®} 2-4 g/d</td>
<td>Crinone\textsuperscript{®} 4% or 8% (45 or 90 mg applicator)</td>
<td>If simultaneously taking oral estrogen tablet, may need to adjust dosing If intact uterus, also take progesterone</td>
</tr>
</tbody>
</table>

CEE = conjugated equine estrogen (e.g. Premarin\textsuperscript{®}); MPA = medroxyprogesterone acetate (e.g. Provera\textsuperscript{®}); NEA = norethindrone acetate
Consider lower dose regimens, PREMPRO\textsuperscript{®} 0.45/1.5 (Premarin\textsuperscript{®} 0.45 mg and Provera\textsuperscript{®} 1.5 mg), Estrace\textsuperscript{®} (topical 17β-estradiol) = 0.1 mg active ingredient/g; Premarin\textsuperscript{®} (topical CEE) = 0.625 mg active ingredient/g; Estragyn\textsuperscript{®} (topical estrone) = 1 mg active ingredient/g

Side Effects of HRT

- abnormal uterine bleeding
- mastodynia: breast tenderness
- edema, bloating, heartburn, nausea
- mood changes (progesterone)
- can be worse in progesterone phase of combined therapy

Contraindications to HRT

- absolute
  - acute liver disease
  - undiagnosed vaginal bleeding
  - history of breast cancer
  - known or suspected uterine cancer/breast cancer
  - acute vascular thrombosis or history of severe thrombophlebitis or thromboembolic disease
  - cardiovascular disease
- relative
  - pre-existing uncontrolled HTN
  - uterine fibroids and endometriosis
  - familial hyperlipidemias
  - migraine headaches
  - family history of estrogen-dependent cancer
  - chronic thrombophlebitis
  - DM (with vascular disease)
  - gallbladder disease, hypertriglyceridemia, impaired liver function (consider transdermal estrogen)
  - fibrocystic disease of the breasts

Absolute Contraindications to HRT

WOMEN'S HEALTH INITIATIVE (launched in 1991)

- two non-randomized studies investigating health risks and benefits of HRT in healthy postmenopausal women 50-79 yr old
  - continuous combined HRT (CEE 0.625 mg + MPA 2.5 mg OD) in 16,608 women with an intact uterus
  - estrogen-alone (CEE 0.625 mg) in 10,739 women with a previous hysterectomy
- both arms of the trial were stopped early because of evidence of increased risk of breast cancer, stroke, PE, and CHD in the combined HRT arm, and increased risk of stroke with no CHD benefits in the estrogen-alone arm
- the apparent increase in CHD was in disagreement with results of previous observational trial
- results of the WHI study have since been challenged and revision of how CHD was diagnosed led to loss of statistical significance of the results
- benefits and risks reported as number of cases per 10,000 women each year

<table>
<thead>
<tr>
<th>Benefits/Effects</th>
<th>Risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vasomotor Symptoms: less frequent and severe with use of either combined or estrogen-alone HRT</td>
<td>Stroke: 8 additional cases with combined HRT, and 12 additional cases for estrogen alone (WHI)</td>
</tr>
<tr>
<td>Osteoporosis: 5 fewer cases of hip fractures and 47 fewer cases of all fractures with combined HRT; 6 fewer cases of hip fractures with estrogen alone</td>
<td>DVT/PE: 18 additional cases with combined HRT, and 9 additional cases for estrogen-alone (WHI)</td>
</tr>
<tr>
<td>Colon Cancer: 6 fewer cases with combined HRT (WHI)</td>
<td>CHD: 7 additional MIs with combined HRT (WHI); secondary analysis suggests greater absolute risk for women aged &gt;70 yr and for women who start HRT &gt;10 yr post-menopause</td>
</tr>
<tr>
<td>One additional case with estrogen-alone</td>
<td>Breast Cancer: 8 additional cases with combined HRT (WHI); risk only increased after &gt;5 yr of combined HRT use; no increased risk for estrogen-alone</td>
</tr>
<tr>
<td>Dementia and Mild Cognitive Impairment: 50% greater risk of developing dementia in women taking estrogen alone after age 65; risk is greater for women taking combined HRT; risk of developing dementia was reduced for women taking HRT before age 65</td>
<td></td>
</tr>
</tbody>
</table>

Table 17. HRT Benefits vs Risks

Figure 21. Pelvic anatomy
Prolapse

Etiology
• relaxation, weakness, or defect in the cardinal and uterosacral ligaments which normally maintain the uterus in an anteflexed position and prevent it from descending through the urogenital diaphragm (i.e. levator ani muscles)
• related to:
  ■ vaginal childbirth
  ■ aging
  ■ decreased estrogen (post-menopause)
  ■ following pelvic surgery
  ■ increased intra-abdominal pressure (obesity, chronic cough, constipation, ascites, heavy lifting)
  ■ congenital (rarely)
  ■ ethnicity (Caucasian women > Asian or African women)
  ■ collagen disorders

GENERAL CONSERVATIVE TREATMENT
(for pelvic relaxation/prolapse and urinary incontinence)
• Kegel exercises
• local vaginal estrogen therapy
• vaginal pessary (intravaginal suspension disc)

Table 18. Pelvic Prolapse

</tbody>
</table>

Urinary Incontinence

• see Urology, U5

STRESS INCONTINENCE

Definition
• involuntary loss of urine with increased intra-abdominal pressure (coughing, laughing, sneezing, walking, running)

Risk Factors for Stress Incontinence in Women
• pelvic prolapse
• pelvic surgery
• vaginal delivery
• hypoestrogenic state (post-menopause)
• age
• smoking
• neurological/pulmonary disease
Treatment
- see Prolapse, General Conservative Treatment, GY37
- surgical
  - tension-free vaginal tape (TVT), tension-free obturator tape (TOT), prosthetic/fascial slings or retropubic bladder suspension (Burch or Marshall-Marchetti-Krantz procedures)

URGE INCONTINENCE

Definition
- urine loss associated with an abrupt, sudden urge to void
- “overactive bladder”
- diagnosed based on symptoms

Etiology
- idiopathic (90%)
- detrusor muscle overactivity (“detrusor instability”)

Associated Symptoms
- frequency, urgency, nocturia, leakage

Treatment
- behaviour modification (reduce caffeine/liquid, smoking cessation, regular voiding schedule)
- Kegel exercises
- medications
  - anticholinergics: oxybutinin (Ditropan®), tolterodine (Detrol®), solifenacin (VESIcare®)
  - tricyclic antidepressants: imipramine

Gynecological Oncology

Uterus

ENDOMETRIAL CARCINOMA

Epidemiology
- most common gynecological malignancy in North America (40%); 4th most common cancer in women
- 2-3% of women develop endometrial carcinoma during lifetime
- mean age is 60 yr
- majority are diagnosed in early stage due to detection of symptoms
- 85-90% 5 yr survival for stage I disease
- 70-80% 5 yr survival for all stages

Clinical Classifications
- Type I is usually characterized as estrogen-related (i.e. excess/unopposed estrogen)
  - includes well-differentiated endometrioid adenocarcinoma
- Type II is usually characterized as non-estrogen related
  - includes serous, clear cell, grade 4 endometrioid and undifferentiated carcinomas as well as carcinosarcoma
  - more aggressive histologic subtypes; prognosis typically worse than type I, with a poorer 5 yr survival
- note: types above have been classified based on typical estrogen dependence. Type II tumours also associated with estrogen factors, but to a lesser degree than Type I

Risk Factors
- general: increasing age and FHx
- Type I, commonly known as “estrogen-related”
  - PCOS
  - Diabetes mellitus
  - unbalanced HRT (balanced HRT is protective)
  - nulliparity
  - late menopause (>55 yr), early menarche
  - estrogen-producing ovarian tumours (e.g. granulosa cell tumours)
  - HNPCC (hereditary non-polyposis colorectal cancer)/Lynch II syndrome
  - tamoxifen
- Type II, commonly known as “non-estrogen related”
  - obesity (though stronger association with Type I)
  - early menarche
  - nulliparity
  - diabetes mellitus
  - increasing age of menarche and number of children not significantly associated with reduced risk in clear-cell endometrial carcinoma
  - has been associated with p53 mutations

Incidence of Malignant Gynecological Lesions in North America
- endometrium > ovary > cervix > vulva > vagina > fallopian tube

Risk Factors for Endometrial Cancer
- COLD NUT
  - Cancer (ovarian, breast, colon)
  - Obesity
  - Late menopause
  - Diabetes mellitus
  - Nulliparity
  - Unopposed estrogen: PCOS, anovulation, HRT
  - Tamoxifen: chronic use

Postmenopausal bleeding = endometrial cancer until proven otherwise (95% present with vaginal bleeding)

An endometrial thickness of 5 mm or more is considered abnormal in a postmenopausal woman with vaginal bleeding
Screening
• no known benefit for mass screening
• routine pelvic ultrasound should not be used as screening test (high false positives)

Clinical Features
• Type I (well-differentiated endometrioid adenocarcinoma) ~80% of cases
  • postmenopausal bleeding in majority, abnormal uterine bleeding in majority of affected premenopausal women (menorrhagia, intermenstrual bleeding)
• Type II (serous, clear cell carcinoma, grade 3 endometrioid, undifferentiated, carcinosarcoma) ~15% of cases
  • may not present with bleeding in early stage, more likely to present with advanced stage disease with symptoms like ovarian cancer (i.e. bloating, bowel dysfunction, pelvic pressure)
  • pelvic exam usually shows normal sized uterus unless there are fibroids, sarcomas or other uterine pathologies associated

Investigations
• endometrial sampling
  • office endometrial biopsy
  • D&C ± hysteroscopy
• ± pelvic ultrasound (in women where adequate endometrial sampling not feasible without invasive methods)
  • not acceptable as alternative to pelvic exam or endometrial sampling to rule out cancer

Table 19. FIGO Staging of Endometrial Cancer (2009)

</tr>
<tr>
<td>IIIB</td>
<td>Vaginal ± parametrical involvement</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Note: endocervical glandular involvement is now considered as Stage I (previously Stage II)

Treatment
• surgical: hysterectomy/bilateral salpingo-oophorectomy (BSO) and pelvic washings ± pelvic and para-aortic node dissection ± omentectomy
  • goals: diagnosis, staging, treatment, defining optimal adjuvant treatment
  • laparoscopic approach associated with improved quality of life (optimal for most patients)
• adjuvant radiotherapy (for improved local control in patients at risk for local recurrence) and adjuvant chemotherapy (in patients at risk for distant recurrence or with metastatic disease): based on presence of poor prognostic factors in definitive pathology
• chemotherapy: often used for recurrent disease (especially if high grade or aggressive histology)
• hormonal therapy: progestins can be used for recurrent disease (especially if low grade)

UTERINE SARCOMA
• rare; 2-6% of all uterine malignancies
• arise from stromal components (endometrial stroma, mesenchymal or myometrial tissues)
• behave more aggressively and are associated with worse prognosis than endometrial carcinoma; 5-yr survival is 35%
• vaginal bleeding is most common presenting symptom
Protective Factors (for epithelial ovarian cancers)

</table>
| 1. Leiomyosarcoma         | Most common type of uterine sarcoma  
                              Average age of presentation is 55 yr but may present in pre-menopausal women  
                              Often coexists with benign leiomyomatosis (fibroids)                      | Histologic distinction from leiomyoma  
                              1. Increased mitotic count (>10 mitoses/10 high power fields)  
                              2. Tumour necrosis  
                              3. Cellular atypia  
                              Rapidly enlarging fibroids in a pre-menopausal woman  
                              Enlarging fibroids in a postmenopausal woman                      | Often post-operatively after uterus removed for presumed fibroids  
                              Stage using FIGO 2009 staging for leiomyosarcomas and ECC          | Hysterectomy/BSO usually  
                              No routine pelvic lymphadenectomy  
                              Chemotherapy is used in cases of metastatic disease  
                              Radiation therapy does not improve local control or survival  
                              Poor outcomes overall, even for early stage disease            |
| 2. Endometrial Stromal Sarcoma (ESS) | Usually presents in perimenopausal or postmenopausal women with abnormal uterine bleeding | Abnormal uterine bleeding  
                              Good prognosis                                                                 | Diagnosed by histology of endometrial biopsy or D&C  
                              Stage using FIGO 2009 staging for leiomyosarcomas and ECC          | Hysterectomy & BSO (remove ovaries as ovaries may stimulate growth)  
                              No routine pelvic lymphadenectomy  
                              Adjunct therapy based on stage and histologic features (hormones and/or radiation)  
                              Hormonal therapy (progestins) may be used for metastatic disease |
| 3. Undifferentiated Sarcoma | Rare; less common than leiomyosarcoma, endometrial stromal sarcoma         | Severe nuclear pleomorphism, high mitotic activity, tumour cell necrosis, and lack smooth muscle or endometrial stromal differentiation  
                              Poor prognosis                                                                 | Often found incidentally post-operatively for abnormal bleeding      | Treatment primarily surgical  
                              Radiation and/or chemotherapy for advanced diseased or unresctectable disease |
| MIXED TYPE                |                                                                              |                                                                          |                                                                          |                                                                          |
| 4. Adenosarcoma           | The rarest of the uterine sarcoma  
                              Mixed tumour of low malignant potential                                    | Present with abnormal vaginal bleeding  
                              Polypoid mass in uterine cavity                                      | Mixture of benign epithelium with malignant low grade sarcoma         | Treatment is surgical with hysterectomy and BSO                           |

Table 20. Summary of Uterine Sarcoma Subtypes and Features

<table>

</table>
| 1. Leiomyosarcoma         | Most common type of uterine sarcoma  
                              Average age of presentation is 55 yr but may present in pre-menopausal women  
                              Often coexists with benign leiomyomatosis (fibroids)                      | Histologic distinction from leiomyoma  
                              1. Increased mitotic count (>10 mitoses/10 high power fields)  
                              2. Tumour necrosis  
                              3. Cellular atypia  
                              Rapidly enlarging fibroids in a pre-menopausal woman  
                              Enlarging fibroids in a postmenopausal woman                      | Often post-operatively after uterus removed for presumed fibroids  
                              Stage using FIGO 2009 staging for leiomyosarcomas and ECC          | Hysterectomy/BSO usually  
                              No routine pelvic lymphadenectomy  
                              Chemotherapy is used in cases of metastatic disease  
                              Radiation therapy does not improve local control or survival  
                              Poor outcomes overall, even for early stage disease            |
| 2. Endometrial Stromal Sarcoma (ESS) | Usually presents in perimenopausal or postmenopausal women with abnormal uterine bleeding | Abnormal uterine bleeding  
                              Good prognosis                                                                 | Diagnosed by histology of endometrial biopsy or D&C  
                              Stage using FIGO 2009 staging for leiomyosarcomas and ECC          | Hysterectomy & BSO (remove ovaries as ovaries may stimulate growth)  
                              No routine pelvic lymphadenectomy  
                              Adjunct therapy based on stage and histologic features (hormones and/or radiation)  
                              Hormonal therapy (progestins) may be used for metastatic disease |
| 3. Undifferentiated Sarcoma | Rare; less common than leiomyosarcoma, endometrial stromal sarcoma         | Severe nuclear pleomorphism, high mitotic activity, tumour cell necrosis, and lack smooth muscle or endometrial stromal differentiation  
                              Poor prognosis                                                                 | Often found incidentally post-operatively for abnormal bleeding      | Treatment primarily surgical  
                              Radiation and/or chemotherapy for advanced diseased or unresctectable disease |
| MIXED TYPE                |                                                                              |                                                                          |                                                                          |                                                                          |
| 4. Adenosarcoma           | The rarest of the uterine sarcoma  
                              Mixed tumour of low malignant potential                                    | Present with abnormal vaginal bleeding  
                              Polypoid mass in uterine cavity                                      | Mixture of benign epithelium with malignant low grade sarcoma         | Treatment is surgical with hysterectomy and BSO                           |

Ovary

**BENIGN OVARIAN TUMOURS**
- see Table 22
- many are asymptomatic
- usually enlarge slowly, if at all
- may rupture or undergo torsion, causing pain
  - pain associated with torsion of an adnexal mass usually originates in the iliac fossa and radiates to the flank
  - peritoneal irritation may result from an infarcted tumour – rare

**MALIGNANT OVARIAN TUMOURS**
- see Table 22

**Epidemiology**
- lifetime risk 1.4%  
  - in women >50 yr, more than 50% of ovarian tumours are malignant
  - causes more deaths in North America than all other gynecologic malignancies combined
  - 4th leading cause of cancer death in women
  - 85% epithelial; 15% non-epithelial
  - 10-15% of epithelial ovarian cancers are related to hereditary predisposition

**Risk Factors (for epithelial ovarian cancers)**
- personal history of breast, colon, endometrial cancer
- family history of breast, colon, endometrial, ovarian cancer
- use of fertility drugs

**Protective Factors (for epithelial ovarian cancers)**
- OCP: likely due to ovulation suppression (significant reduction in risk even after 1 yr of use)
- pregnancy/breastfeeding
- salpingectomy (prophylactic)
- BSO (prophylactic surgery performed for this reason in high risk women – i.e. BRCA mutation carriers)
### Screening
- no effective method of mass screening
- routine CA-125 level measurements or U/S not recommended
- high false positive rates
- controversial in high risk groups: transvaginal U/S and CA-125, starting age 30 (no consensus on interval)
  - familial ovarian cancer (>1 first degree relative affected, BRCA-1 mutation)
  - other cancers (e.g. endometrial, breast, colon)
  - BRCA-1 or BRCA-2 mutation: recommendation is prophylactic bilateral oophorectomy after age 35 or when child-bearing is completed

### Clinical Features
- most women with epithelial ovarian cancer present with advanced stage disease since often “asymptomatic” until disseminated disease (symptoms with early stage disease are vague and non-specific)
- when present, symptoms may include
  - abdominal symptoms (nausea, bloating, dyspepsia, anorexia, early satiety)
  - symptoms of mass effect
    - increased abdominal girth – from ascites or tumour itself
    - urinary frequency
    - constipation

### Low Malignant Potential (also called “Borderline”) Tumours
- a subcategory or epithelial ovarian cancer (~15% of all epithelial ovarian tumours)
- pregnancy, OCP, and breastfeeding are protective factors
- tumour cells with histologically malignant characteristics arise from the ovarian surface, but do not invade ovarian stroma.
- able to metastasize, but not commonly
- treated primarily with surgery (BSO/omentectomy ± hysterectomy)
  - NO proven benefit of chemotherapy
  - generally slow growing, excellent prognosis
  - 5yr survival >99%
  - recurrences tend to occur late, may be associated with low grade serous carcinoma

### Investigation of Suspicious Ovarian Mass
- women with suspected ovarian cancer based on history, physical, or investigations should be referred to a gynecologic oncologist
- bimanual examination
  - solid, irregular, or fixed pelvic mass is suggestive of ovarian cancer
- RMI (Risk of Malignancy Index) is best tool available to assess likelihood of ovarian malignancy and need for pre-operative gynecologic oncology referral (see sidebar, GY??)
- physical exam findings largely dependent on stage of disease
- blood work: CA-125 for baseline, CBC, liver function tests, electrolytes, creatinine
- radiology
  - transvaginal ultrasound best to visualize ovaries
  - CT abdomen and pelvis to look for metastatic disease
  - bone scan or PET scan not indicated
- try to rule out other primary source if suspected, based on:
  - occult blood per rectum: endoscopy ± barium enema
  - gastric symptoms: gastroscopy ± upper GI series
  - abnormal vaginal bleeding: endometrial biopsy to rule out concurrent endometrial cancer; abnormal cervix: need to biopsy cervix (NOT pap smear) breast lesion identified or risk factors present: mammogram

![Effects of Screening on Ovarian Cancer Mortality: The Prostate, Lung, Colorectal, and Ovarian Cancer Screening Randomized Controlled Trial](image)
Malignant Cervical Lesions

- **Etiology**
  - at birth, vagina is lined with squamous epithelium; columnar epithelium lines only the endocervix and the central area of the ectocervix (original squamocolumnar junction)
  - during puberty, estrogen stimulates eversion of a single columnar layer (ectopy), thus exposing it to the acidic pH of the vagina, leading to metaplasia (change of exposed epithelium from columnar to squamous)
  - a new squamocolumnar junction forms as a result
  - the transformation zone (TZ) is the area located between the original and the current squamocolumnar junction
  - the majority of dysplasias and cancers arise in the TZ of the cervix
  - must have active metaplasia in presence of inducing agent (HPV) to get dysplasia
  - dysplasia → carcinoma in situ (CIS) → invasion
  - slow process (~10 yr on average)
  - growth is by local extension
  - metastasis occurs late

**Risk Factors**
- HPV infection
  - see Sexually Transmitted Infections, GY27
  - high risk of neoplasia associated with types 16, 18
  - low risk of neoplasia associated with types 6, 11
  - >99% of cervical cancers contain one of the high risk HPV types
  - high risk behaviours (risk factors for HPV infection)
    - multiple partners
    - other STIs (HSV, trichomonas)
    - early age at first intercourse
    - high risk male partner

</table>

**Cervix**

**Benign Cervical Lesions**
- Nabothian cyst/inclusion cyst
- no treatment required
- endocervical polyps
- treatment is polypectomy (office procedure)

**Malignant Cervical Lesions**

**Epidemiology**
- majority are SCC (70%); adenocarcinomas increasing (25%); rare subtypes include small cell, adenosquamous
- 8,000 deaths annually in North America
- annual Pap test reduces a woman's chance of dying from cervical cancer from 0.4% to 0.05%
- average age at presentation: 52 yr old

**Figure 22. The cervix**

Cervical cancer is most prevalent in developing countries and therefore is the only gynecologic cancer that uses clinical staging; this facilitates consistent international staging with countries that do not have technologies, such as CT and MRI.
Cervical Cancer Screening Guidelines (Pap Test)

- see Family Medicine, FM5

Clinical Features

- SCC: exophytic, fungating tumour
- adenocarcinoma: endophytic, with barrel-shaped cervix
- early
  - asymptomatic
  - discharge: initially watery, becoming brown or red
- postcoital bleeding
- late
  - 80-90% present with bleeding; either postcoital, postmenopausal or irregular bleeding
  - pelvic or back pain (extension of tumour to pelvic walls)
  - bladder/bowel symptoms
- signs
  - friable, raised, reddened, or ulcerated area visible on cervix

Diagnosis

- colposcopy is a clinical procedure that facilitates identification and biopsy of suspicious cells
- in colposcopy:
  - apply acetic acid and identify acetowhite lesions, punctuation, mosaicism, and abnormal blood vessels to guide cervical biopsy
  - endocervical curettage (ECC) if entire lesion is not visible or no lesion visible
  - diagnostic excision (LEEP) if:
    - unsatisfactory colposcopy (poor visualization/access to transformation zone)
    - discrepancy between cytology, colposcopy, and histological findings
    - positive findings/glandular abnormalities in endocervical curettage
    - suspicious for adenocarcinoma in situ (consider cold-knife conization)
    - recurrence of lesion post-ablation or excision
    - inability to rule out invasive disease, i.e. large lesions (lesions extending into endocervical canal, extending widely on cervix, or onto vaginal epithelium)
- consider cold knife conization (in OR) if glandular abnormality suspected based on cytology or colposcopic findings due to concern for margin interpretation
- tests permitted for FIGO clinical staging include: physical exam (including examination under anesthesia), cervical biopsy (including cone biopsy), proctoscopy/cystoscopy, IVP, ultrasound liver/kidneys, CXR, LFTs
- MRI and/or CT and/or PET scan often done to facilitate planning of radiation therapy, results do not influence clinical stage

Figure 23. Decision making chart for Pap test (not applicable for adolescents)
Adapted from: Ontario Cervical Screening Practice Guidelines. May 2012. Cervical screening guidelines unique to each province

The Bethesda Classification System is based on cytological results of a Pap test that permits the examination of cells but not tissue structure. Cervical intraepithelial neoplasia (CIN) or cervical carcinoma is a histological diagnosis, requiring a tissue sample via biopsy of suspicious lesions seen during colposcopy

With development of hypertension early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease

CA-125 is indicated for monitoring response to treatment

Causes of Elevated CA-125

- Age influences reliability of test as a tumour marker
- 50% sensitivity in early stage ovarian cancer (poor) – therefore not good for screening
  - Malignant
    - Gyn: ovary, uterus
    - Non-Gyn: pancreas, stomach, colon, rectum
  - Non-Malignant
    - Gyn: benign ovarian neoplasm, endometriosis, pregnancy, fibroids, PID
    - Non-Gyn: cr hoss, pancreatitis, renal failure

• smoking
• poor screening uptake is the most important risk factor for cervical cancer in Canada
• at-risk groups include:
  - immigrant Canadians
  - First Nations Canadians
  - geographically isolated Canadians
  - sex-trade workers
  - low socioeconomic status

*Gardasil-9 also covers types 31, 33, 45, 52, and 58; also used to prevent genital warts

- should be administered before onset of sexual activity (i.e. before exposure to virus) for optimal benefit of vaccination
- may be given at the same time as hepatitis B or other vaccines using a different injection site
- not for treatment of active infections
- most women will not be infected with all four types of the virus at the same time, therefore vaccine is still indicated for sexually active females or those with a history of previous HPV infection or HPV-related disease
- conception should be avoided until 30 d after last dose of vaccination

<td><strong>Stages IB2 (&gt;4 cm), II, III, IV</strong></td>
</tr>
<tr>
<td>Primary chemoradiation therapy</td>
</tr>
<tr>
<td>CT assess extent of disease: evaluate pelvic and para-aortic nodes</td>
</tr>
<tr>
<td>For positive nodes on PET: primary chemoradiation with extended field RT</td>
</tr>
<tr>
<td>Hysterectomy generally not suggested following primary treatment with curative intent</td>
</tr>
</tbody>
</table>

Abnormal Pap Tests in Pregnancy
- incidence: 1/2,200
- Pap test at all initial prenatal visits
  - if abnormal Pap or suspicious lesion, refer to colposcopy
  - if diagnostic conization required, should be deferred until second trimester (T2) to minimize risk of pregnancy loss
  - if invasive cancer ruled out, management of dysplasia deferred until completion of pregnancy (may deliver vaginally)
  - if invasive cancer present, management depends on prognostic factors, degree of fetal maturity, and patient wishes
    - general recommendations in T1: consider pregnancy termination, management with either radical surgery (hysterectomy vs. trachelectomy if desires future fertility), or concurrent chemoradiation therapy
    - recommendations in T2/T3: delay of therapy until viable fetus and C/S for delivery with concurrent radical surgery or subsequent concurrent chemoradiation therapy

Vulva

BENIGN VULVAR LESIONS

Non-Neoplastic Disorders of Vulvar Epithelium
- biopsy is necessary to make diagnosis and/or rule out malignancy
- hyperplastic dystrophy (squamous cell hyperplasia)
  - surface thickened and hyperkeratotic
  - pruritus most common symptom
  - typically postmenopausal women
  - treatment: 1% fluorinated corticosteroid ointment bid for 6 wk
- lichen sclerosis
  - subepithelial fat becomes diminished; labia become thin, atrophic, with membrane-like epithelium and labial fusion
  - pruritus, dyspareunia, burning
  - figure of 8’ distribution
  - most common in postmenopausal women but can occur at any age
  - treatment: ultrapotent topical steroid 0.05% clobetasol x 2-4 wk then taper down, can consider long term suppression twice a week
- mixed dystrophy (lichen sclerosis with epithelial hyperplasia)
  - hyperkeratotic areas with areas of thin, shiny epithelium
  - treatment: fluorinated corticosteroid ointment
**Tumours**
- papillary hidradenoma, nevus, fibroma, hemangioma

**MALIGNANT VULVAR LESIONS**

**Epidemiology**
- 5% of genital tract malignancies
- 90% SCC; remainder melanomas, basal cell carcinoma, Paget’s disease, Bartholin’s gland carcinoma
  - Type I disease: HPV-related (50-70%)
    - more likely in younger women
    - 90% of vulvar intraepithelial neoplasia (VIN) contain HPV DNA (usually types 16, 18)
  - Type II disease: not HPV-related, associated with current or previous vulvar dystrophy
    - usually postmenopausal women

**Risk Factors**
- HPV infection
- VIN: precancerous change which presents as multicentric white or pigmented plaques on vulva (may only be visible at colposcopy)
  - progression to cancer rarely occurs with appropriate management
  - treatment: local excision (i.e. superficial vulvectomy ± split thickness skin grafting to cover defects if required) vs. ablative therapy (i.e. laser, cauterization) vs. local immunotherapy (imiquimod)

**Clinical Features**
- many patients asymptomatic at diagnosis (many also deny or minimize symptoms)
- most lesions occur on the labia majora, followed by the labia minora (less commonly on the clitoris or perineum)
  - localized pruritus or lesion most common
- less common: raised red, white or pigmented plaque, ulcer, bleeding, discharge, pain, dysuria
- patterns of spread
  - local
  - groin lymph nodes (usually inguinal → pelvic nodes)
  - hematogenous

**Investigations**
- ± colposcopy
- ALWAYS biopsy any suspicious lesion
  - do not remove entire lesion so if malignant, site can be identified for sentinel LN injection

**Prognosis**
- depends on stage – particularly nodal involvement (single most important predictor followed by tumour size)
- lesions >4 cm associated with poorer prognosis
- overall 5 yr survival rate: 79%

**Treatment**
- T1 lesions (tumour confined to vulva; no extension to adjacent perineal structures): Radical local excision
- T2 lesions (tumour of any size with extension to adjacent perineal structures): modified radical vulvectomy
- T3 lesions (extension to any of: proximal 2/3 of urethra, proximal 2/3 of the vagina, bladder mucosa, rectal mucosa or fixed to pelvic bone): chemoradiation followed by selective resection of residual primary
- node positive disease: adjuvant chemoradiation or radiation therapy

**Vagina**

**BENIGN VAGINAL LESIONS**
- inclusion cysts
  - cysts form at site of abnormal healing of laceration (e.g. episiotomy)
  - no treatment required
- endometriosis
  - dark lesions that tend to bleed at time of menses
  - treatment: excision
- Gartner's duct cysts
  - remnants of Wolffian duct, seen along side of cervix
  - treatment: conservative unless symptomatic
- urethral diverticulum
  - can lead to recurrent urethral infection, dyspareunia
  - treatment: surgical correction if symptomatic
MALIGNANT VAGINAL LESIONS

Epidemiology
- primary carcinomas of the vagina represent 2-3% of malignant neoplasms of the female genital tract
- 80-90% are SCC
- more than 50% diagnosed between 70-90 yr old

Risk Factors
- associated with HPV infection (analogous to cervical cancer)
- increased incidence in patients with prior history of cervical and vulvar cancer

Investigations
- cytology
  - significant false negative rate for existing malignancy (i.e. if gross lesion present, biopsy!)
- colposcopy
- Schiller test (normal squamous epithelium takes up Lugol's iodine)
- biopsy, partial vaginectomy (wide local excision for diagnosis)
- rule out disease on cervix, vulva, or anus (most vaginal cancers are actually metastatic from one of these sites)
- staging

Clinical Features

<table>
<thead>
<tr>
<th>Type</th>
<th>Clinical Features</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vaginal Intra-Epithelial Neoplasia (VAIN)</td>
<td>Grades: analogous to cervical dysplasia</td>
</tr>
<tr>
<td>Squamous Cell Carcinoma (SCC)</td>
<td>Most common site is upper 1/3 of posterior wall of vagina&lt;br&gt;Asymptomatic&lt;br&gt;Painless discharge and bleeding&lt;br&gt;Vaginal discharge (often foul-smelling)&lt;br&gt;Vaginal bleeding especially during/post-coitus&lt;br&gt;Urinary and/or rectal symptom 2° to compression</td>
</tr>
<tr>
<td>Adenocarcinoma</td>
<td>Most are metastatic, usually from cervix, endometrium, ovary, or colon&lt;br&gt;Most primaries are clear cell adenocarcinomas&lt;br&gt;2 types: non-DES and DES syndrome</td>
</tr>
</tbody>
</table>

Treatment
- Stage I
  - radiation therapy: for tumours >2 cm diameter or tumour involvement of the mid to lower vagina
  - surgical excision: radical hysterectomy, upper vaginectomy and bilateral pelvic lymphadenectomy
- Stage II - IV: chemoradiation

Fallopian Tube

- least common site for carcinoma of female reproductive system (0.3%)
- usually serous epithelial carcinoma
- new evidence shows that some serous ovarian cancers originate in the fallopian tube
- more common in fifth and sixth decade

Clinical Features
- classic triad present in minority of cases, but very specific
  - watery discharge (most specific) = “hydrops tubae profluens”
  - vaginal bleeding or discharge in 50% of patients
  - crampy lower abdominal/pelvic pain
  - most patients present with a pelvic mass (see Ovarian Tumours, GY40 for guidelines regarding diagnosis/investigation)

Treatment
- as for malignant epithelial ovarian tumours
Gestational Trophoblastic Disease/Neoplasia

- refers to a spectrum of proliferative abnormalities of the trophoblast

**Epidemiology**
- 1/1,000 pregnancies
- marked geographic variation – as high as 1/125 in Taiwan
- 80% benign, 15% locally invasive, 5% metastatic
- cure rate >95%

**HYDATIDIFORM MOLE (Benign GTD)**

**Complete Mole**
- most common type of hydatidiform mole
- diffuse trophoblastic hyperplasia, hydropic swelling of chorionic villi, no fetal tissues, or membranes present
- 46XX or 46XY, chromosomes completely of paternal origin (90%)
- 2 sperm fertilize empty egg or 1 sperm with reduplication
- 15-20% risk of progression to malignant sequelae
- risk factors
  - geographic (South East Asia most common)
  - others (maternal age >40 yr, β-carotene deficiency, vitamin A deficiency) – not proven
- clinical features
  - often present during apparent pregnancy with abnormal symptoms/findings
  - vaginal bleeding (97%)
  - excessive uterine size for LMP (51%)
  - theca-lutein cysts >6 cm (50%)
  - preeclampsia (27%)
  - hyperemesis gravidarum (26%)
  - hyperthyroidism (7%)
  - β-hCG >100,000 IU/L
  - no fetal heart beat detected

**Partial (or Incomplete) Mole**
- focal trophoblastic hyperplasia and hydropic villi are associated with fetus or fetal parts
- often triploid (XXY XYY, XXX) with chromosome complement from both parents
  - usually related to single ovum fertilized by two sperm
- low risk of progression to malignant sequelae (<4%)
- associated with fetus, which may be growth-restricted, and/or have multiple congenital malformations
- clinical features
  - typically present similar to threatened/spontaneous/missed abortion
  - pathological diagnosis often made after D&C

**Investigations**
- quantitative β-hCG levels (tumour marker) abnormally high for gestational age
- U/S findings
  - if complete: no fetus (classic “snow storm” due to swelling of villi)
  - if partial: molar degeneration of placenta ± fetal anomalies, multiple echogenic regions corresponding to hydropic villi, and focal intrauterine hemorrhage
- CXR (may show metastatic lesions)
- features of molar pregnancies at high risk of developing persistent GTN post-evacuation
  - local uterine invasion as high as 31%
  - β-hCG >100,000 IU/L
  - excessive uterine size
  - prominent theca-lutein cysts

**Treatment**
- suction D&C with sharp curettage and oxytocin
- Rhogam® if Rh negative
- consider hysterectomy (if patient no longer desires fertility)
- prophylactic chemotherapy of no proven benefit
- chemotherapy for GTN if develops after evacuation

**Follow-Up**
- contraception required to avoid pregnancy during entire follow-up period
- serial β-hCGs (as tumour marker) every week until negative x 3 (usually takes several wk), then monthly for 6-12 mo prior to trying to conceive again
- increase or plateau of β-hCG indicates GTN → patient needs chemotherapy

With development of hypertonion early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease
GTN (MALIGNANT GTD)

Invasive Mole or Persistent GTN
- diagnosis made by rising or plateau in β-hCG, development of metastases following treatment of documented molar pregnancy
- histology: molar tissue from D&C
- metastases are rare (4%)

Choriocarcinoma
- often present with symptoms from metastases
- highly anaplastic, highly vascular
- no chorionic villi, elements of syncytiotrophoblast and cytotrophoblast
- may follow molar pregnancy, abortion, ectopic, or normal pregnancy

Placental-Site Trophoblastic Tumour
- rare aggressive form of GTN
- abnormal growth of intermediate trophoblastic cells
- low β-hCG, production of human placental lactogen (hPL), relatively insensitive to chemotherapy

CLASSIFICATION of GTN
- non-metastatic
  - ~15% of patients after molar evacuation
  - may present with abnormal bleeding
  - all have rising or plateau of β-hCG
  - negative metastases on staging investigations
- metastatic
  - 4% patients after treatment of complete molar pregnancy
  - metastasis more common with choriocarcinoma which tends toward early vascular invasion and widespread dissemination
  - if signs or symptoms suggest hematogenous spread, do not biopsy (they bleed)
    - lungs (80%): cough, hemoptysis, CXR lesion(s)
    - vagina (30%): vaginal bleeding, "blue lesions" on speculum exam
    - pelvis (20%): rectal bleeding (if invades bowel), U/S lesion(s)
    - liver (10%): elevated LFTs, U/S or CT findings
    - brain (10%): headaches, dizziness, seizure (symptoms of space-occupying lesion), CT/MRI findings
  - highly vascular tumour → bleeding → anemia
  - all have rising or plateau of β-hCG
  - classification of metastatic GTN
    - divided into good prognosis and bad prognosis
      - features of bad prognosis
        - long duration (>4 mo from antecedent pregnancy)
        - high pre-treatment β-hCG titre: >100,000 IU/24 h urine or >40,000 IU/L of blood
        - brain or liver metastases
        - prior chemotherapy
        - metastatic disease following term pregnancy
      - good prognosis characterized by the absence of each of these features

Investigations – For Staging
- blood work: CBC, electrolytes, creatinine, β-hCG, TSH, LFTs
- imaging: CXR, U/S pelvis, CT abdo/pelvis, CT brain
- if suspect brain metastasis but CT brain negative, consider lumbar puncture for CSF β-hCG
- ratio of plasma β-hCG:CSF β-hCG <60 indicates metastases

Table 28. FIGO Staging and Management of Malignant GTN

<table>
<thead>
<tr>
<th>Stage</th>
<th>Findings</th>
<th>Management</th>
</tr>
</thead>
</table>
| I     | Disease confined to uterine corpus | Single agent chemotherapy for low risk disease (WHO score ≤ 6)  
  - 1st line: pulsed – actinomycin D (Act-D) IV q2wk  
  - Alternatives: MTX-based regimen  
  - 20% of patients need to switch to alternate single-agent regimen due to failure of β-hCG to return to normal  
  - Combination chemotherapy (EMA-CO: etoposide, MTX, ACT-D, cyclophosphamide, vincristine) if high risk (WHO score ≥7) or if resistant to single agent chemotherapy  
  - Can consider hysterectomy if fertility not desired or placental-site trophoblastic tumour |
| II    | Metastatic disease to genital structures | As above |
| III   | Metastatic disease to lungs with or without genital tract involvement | As above |
| IV    | Distant metastatic sites including brain, liver, kidney, GI tract | Usually high risk (EMA-CO) with surgical resection of sites of disease  
  - Persistence/resistance to chemotherapy  
  - Consider radiation for brain mets |

### Follow-up (for GTN)
- Contraception for all stages to avoid pregnancy during entire follow-up period
  - stage I, II, III
    - weekly β-hCG until 3 consecutive normal results
    - then monthly x 12 mo
  - stage IV
    - weekly β-hCG until 3 consecutive normal results
    - then monthly x 24 mo

### GTN Diagnosis
- β-hCG plateau: <10% drop in β-hCG over four values in 3 wk (e.g. days 1, 7, 14, and 21) OR
- β-hCG rise >20% in any two values over two wk or longer (e.g. measure at days 1, 7, 14) OR
- β-hCG persistently elevated >6 mo OR
- metastases on workup

</table>
| doxycycline | Tetracycline derivative; inhibit protein synthesis | 100 mg PO bid x ≥7 d | Chlamydia, gonococcal infection, syphilis | S/E: GI upset, hepatotoxicity  
C/I: pregnancy, severe hepatic dysfunction  
D/I: warfarin, digoxin |
| fluconazole (Diflucan<sup>®</sup>) | Antifungal; disrupt fungal cell membrane | 150 mg PO x 1 dose | Vulvovaginal candidiasis unresponsive to clotrimazole | S/E: headache, rash, N/V, abdominal pain, diarrhea  
C/I: tetracycline, cisapride, astemizole, hydrochlorothiazide, phenytoin, warfarin, rifampin |
| leuprolide (Lupron<sup>®</sup>) | Synthetic GnRH analog  
Induces reversible hypoestrogenic state | 3.75 mg IM q1 mo or 11.25 mg IM q3 mo  
Usually ≤6 mo, check bone density if >6 mo  
Retreatment with Lupron<sup>®</sup> alone not recommended because of effects on bone density | Endometriosis  
Leiomyomata  
DUB  
Precocious puberty | S/E: hot flashes, sweats, headache, vaginitis, reduction in bone density, acne, GI upset  
C/I: pregnancy, undiagnosed vaginal bleeding, breastfeeding |
| menotropin (Pergonal<sup>®</sup>) | Human gonadotropin with FSH and LH effects; induce ovulation and stimulate ovarian follicle development | 75-150 U of FSH and LH IM OD x 7 12 d, then 10,000 U HCG one day after last dose | Infertility | S/E: blushing, irritation at injection site, abdominal/pelvic pain, headache, N/V, multiple pregnancy  
C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, undiagnosed uterine bleeding |
| metronidazole (Flagyl<sup>®</sup>) | Bactericidal; forms toxic metabolites which damage bacterial DNA | 2 g PO x 1 dose or 500 mg PO bid x 7 d | Bacterial vaginosis, trichomonas vaginitis | S/E: headache, diziness, N/V, diarrhea, disulfiram-like reaction (flushing, tachycardia, N/V)  
C/I: pregnancy (1st trimester)  
D/I: cisapride, warfarin, cimetidine, lithium, alcohol, amiodarone, milk thistle, carbamazepine |
| oxybutinin (Ditropan<sup>®</sup>) | Anticholinergic – relaxes bladder smooth muscle, inhibits involuntary detrusor contraction | 5 or 10 mg/d PO  
May increase doses by 5 mg weekly to a max of 30 mg/d | Overactive bladder (urge incontinence) | S/E: dry mouth/eyes, constipation, palpitations, urinary retention, diziness, headache  
C/I: glaucoma, GI ischa, severe colitis, obstructive uropathy, use with caution if impaired hepatic/renal function |
| tolterodine (Detrol<sup>®</sup>) | Anticholinergic | 1-2 mg PO bid | Overactive bladder (urge incontinence) | S/E: anaphylaxis, psychosis, tachycardia, dry mouth/eyes, headache, constipation, urinary retention, chest pain, abdominal pain  
C/I: glaucoma, gastric/urinary retention, use with caution if impaired hepatic/renal function |
| tranexamic acid (Cyklokapron<sup>®</sup>) | Anti-fibrinolytic, reversibly inhibits plasminogen activation | 1-1.5 g tid-qid for first 4 d of cycle  
Max 4 g/d  
Ophthalmic check if used for several wk | Menorrhagia | S/E: N/V, diarrhea, diziness, rare cases of thrombosis, abdominal pain, MI/MIK pain  
C/I: thromboembolic disease, acquired disturbances of colour vision, subarachnoid hemorrhage, age <15 yr |
| ulipristal acetate (Fibristal<sup>®</sup>) | Selective progesterone receptor modulator (SPRM) | 5 mg PO OD for max 3 mo; first tablet taken anytime during first 7 days of menstruation | Leiomyoma (pre-operative) | S/E: headache, hot flushes, constipation, vertigo, endometrial thickening  
C/I: pregnancy, undiagnosed vaginal bleeding, any gynae cancer |
| urofollitropin (Metrodin<sup>®</sup>) | FSH | 75 U/d SC x 7-12d | Ovulation induction in PCOS | S/E: ovarian enlargement or cysts, edema and pain at injection site, arterial thromboembolism, fever, abdominal pain, headache, multiple pregnancy  
C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, abnormal uterine bleeding |

Hematopoiesis

- over $10^{11}$ blood cells are produced daily
- sites of hematopoiesis in adults: pelvis, sternum, vertebral bodies, cranium
- lifespan of mature cells in blood
  - erythrocytes (90-120 d), neutrophils (~1 d), platelets (7-10 d), lymphocytes (varies – memory cells persist for years)
- role of lymphoid organs
  - spleen: part of reticuloendothelial system, sequesters aged RBCs, removes opsonized cells, site of antibody production
  - thymus: site of T-cell maturation, invovles with age
- lymph nodes: sites of B and T-cell activation (adaptive immune response)
### Complete Blood Count

#### Table 1. Common Terms Found in the CBC

<table>
<thead>
<tr>
<th>Test</th>
<th>Definition</th>
<th>Normal Values*</th>

</tr>
<tr>
<td><strong>Mean Platelet Volume (MPV)</strong></td>
<td>Measurement of platelet size</td>
<td>7.2-11.7 FL</td>
</tr>
<tr>
<td><strong>Reticulocytes</strong></td>
<td>Immature RBCs that contain no nucleus but have residual RNA</td>
<td>Normally make up 1% of total RBC count</td>
</tr>
</tbody>
</table>

*Normal values may vary depending on site and age

---

**Approach to Interpreting a CBC**

1. **consider values in the context of individual’s baseline:**
   - up to 5% of population without disease may have values outside “normal” range
   - an individual may display a clinically significant change from their baseline without violating “normal” reference range

2. **is one cell line affected or are several?**
   - if all lines are low: pancytopenia (see Pancytopenia, H8)
   - if RBCs and platelets are low: consider a MAHA/TMA (see Microangiopathic Hemolytic Anemia/Thrombotic Microangiopathy, H22)
   - if single cell line affected: see Common Presenting Problems, H6

---

**Blood Film Interpretation**

**RED BLOOD CELLS**

**Size**
- microcytic (MCV <80 µm³), normocytic (MCV = 80-100 µm³), macrocytic (MCV >100 µm³)
- anisocytosis: RBCs with increased variability in size (increased RDW)
  - iron deficiency anemia, hemolytic anemias, myelofibrosis, blood transfusion, MDS

**Colour**
- hypochromic: increase in size of central pallor (normal = less than 1/3 of RBC diameter)
- iron deficiency anemia, anemia of chronic disease sideroblastic anemia
- polychromasia: increased reticulocytes (pinkish-blue cells)
- increased RBC production by bone marrow

**Shape**
- poikilocytosis: increased proportion of RBCs of abnormal shape
  - iron deficiency anemia, myelofibrosis, severe B₁₂ deficiency, MDS, burns
### Table 2. Common Erythrocyte Shapes

<table>
<thead>
<tr>
<th>Shape</th>
<th>Definition</th>
<th>Associated Conditions</th>

</thead>
<tbody>
<tr>
<td>Discocyte</td>
<td>Biconcave disc</td>
<td>Normal RBC</td>
</tr>
<tr>
<td>Spherocyte</td>
<td>Spherical RBC (due to loss of membrane)</td>
<td>Hereditary spherocytosis, immune hemolytic anemia, post-transfusion</td>
</tr>
<tr>
<td>Elliptocyte/Ovalocyte</td>
<td>Oval-shaped, elongated RBCs</td>
<td>Hereditary elliptocytosis, megaloblastic anemia, iron-deficiency, MDS (myelodysplastic syndrome)</td>
</tr>
<tr>
<td>Schistocyte (helmet cell, fragment)</td>
<td>Fragmented cells (due to traumatic disruption of membrane)</td>
<td>Microangiopathic hemolytic anemia (HUS, aHUS, TTP, DIC, preeclampsia, HELLP, malignant HTN, vasculitis, glomerulonephritis, prosthetic heart valve)</td>
</tr>
<tr>
<td>Sickle Cell</td>
<td>Sickle-shaped RBC (due to polymerization of hemoglobin S)</td>
<td>Sickle cell disorders: HbSC, HbSS</td>
</tr>
<tr>
<td>Codocyte (target cell)</td>
<td>“Bull’s eye” on dried film</td>
<td>Liver disease, hemoglobin SC, thalassemia, iron deficiency, asplenia</td>
</tr>
<tr>
<td>Dacrocyte (teardrop cell)</td>
<td>Single pointed end, looks like a teardrop</td>
<td>Myelofibrosis, thalassemia major, megaloblastic anemia, bone marrow infiltration</td>
</tr>
<tr>
<td>Acanthocyte (spur cell)</td>
<td>Distorted RBC with irregularly distributed thorn-like projections (due to abnormal membrane lipids)</td>
<td>Severe liver disease (spur cell anemia), starvation/anorexia, post-splenectomy</td>
</tr>
<tr>
<td>Echinocyte (bur cell)</td>
<td>RBC with numerous regularly spaced, small spiny projections</td>
<td>Uremia, HUS, burns, cardiopulmonary bypass, post-transfusion, storage artifact</td>
</tr>
<tr>
<td>Rouleaux Formation</td>
<td>Aggregates of RBC resembling stacks of coins (due to increased plasma concentration of high molecular weight proteins)</td>
<td>Pregnancy is most common cause (due to physiological increase in fibrinogen) Inflammatory conditions (due to polyclonal immunoglobulins) Plasma cell dyscrasias (due to monoclonal paraproteinemia, e.g. multiple myeloma, macroglobulinemia) Storage artifact</td>
</tr>
</tbody>
</table>

DIC = disseminated intravascular coagulation; HELLP = hemolysis, elevated liver enzymes, and low platelet count; HUS = hemolytic uremic syndrome; aHUS = atypical HUS; TTP = thrombotic thrombocytopenic purpura

Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

### Table 3. RBC Inclusions

<table>
<thead>
<tr>
<th>Inclusions</th>
<th>Definition</th>
<th>Associated Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nucleus</td>
<td>Present in erythroblasts (immature RBCs)</td>
<td>Hyperplastic erythropoiesis (seen in hypoxia, hemolytic anemia), BM infiltration disorders, MPNs (MF)</td>
</tr>
<tr>
<td>Heinz Bodies</td>
<td>Denatured and precipitated hemoglobin</td>
<td>G6PD deficiency (post-exposure to oxidant), thalassemia, unstable hemoglobins</td>
</tr>
<tr>
<td>Howell-Jolly Bodies</td>
<td>Small nuclear remnant resembling a pyknotic nucleus</td>
<td>Post-splenectomy, hyposplenism (sickle cell disease), neonates, megaloblastic anemia</td>
</tr>
<tr>
<td>Basophilic Stippling</td>
<td>Deep blue granulations indicating ribosome aggregation</td>
<td>Thalassemia, heavy metal (Pb, Zn, Ag, Hg) poisoning, megaloblastic anemia, hereditary (pyrimidine 5’nucleotidase deficiency)</td>
</tr>
<tr>
<td>Sideroblasts</td>
<td>Erythrocytes with Fe containing granules in the cytoplasm</td>
<td>Hereditary, idiopathic, drugs, hypothyroidism (see Sideroblastic Anemia, H183), myelodysplastic syndrome, toxins (lead)</td>
</tr>
</tbody>
</table>

BM = bone marrow; MF = myelofibrosis; MPN = myeloproliferative neoplasm

Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012
WHITE BLOOD CELLS

• lymphocytes
  • comprise 30-40% of WBCs; great variation in “normal” lymphocyte morphology

• neutrophils
  • normally, only mature neutrophils (with 3-4 lobed nucleus) and band neutrophils (immediate precursor with horseshoe-shaped nucleus) are found in circulation
  • hypersegmented neutrophil: >5 lobes suggests megaloblastic process (B12 or folate deficiency)
  • left shift (increased granulocyte precursors)
    • seen in leukemoid reactions: acute infections, pregnancy, neonates, hypoxia, shock, myeloproliferative neoplasms (CML, MF)

• blasts
  • immature, undifferentiated precursors; associated with acute leukemia, MDS, G-CSF (growth factor that stimulates neutrophil production) use

Table 4. Abnormal White Blood Cells on Film

<table>
<thead>
<tr>
<th>Appearance</th>
<th>Definition</th>
<th>Associated Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reed-Sternberg Cell</td>
<td>Giant, multinucleated B-lymphocyte, (classic 'owl-eye' morphology)</td>
<td>Primarily Hodgkin lymphoma, also seen in some non-Hodgkin lymphoma, CLL, and EBV infection</td>
</tr>
<tr>
<td>Smudge Cell</td>
<td>Lymphocytes damaged during blood film preparation indicating cell fragility</td>
<td>CLL and other lymphoproliferative disorders Pathognomonic in EBV infection</td>
</tr>
<tr>
<td>Auer Rod</td>
<td>Cytoplasmic inclusions that form long needles in the cytoplasm of myeloblasts</td>
<td>Pathognomonic for acute myeloid leukemia (AML)</td>
</tr>
<tr>
<td>Atypical Lymphocyte</td>
<td>Pale blue cytoplasm following RBC edges with pink granules</td>
<td>Viruses (particularly EBV) T-cell large granular lymphocyte leukemia (T-LGL)</td>
</tr>
</tbody>
</table>

EBV = Epstein-Barr virus; CLL = chronic lymphocytic leukemia
Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012 and Danielle Sayeau 2017

PLATELETS

• small, purple, anuclear cell fragments

Bone Marrow Aspiration and Biopsy

• sites: posterior iliac crest, sternum
• analyses: most often done together
  • aspiration: takes a fluid marrow sample for cellular morphology, flow cytometry, cytogentic studies, microbiology (C&S, acid-fast bacilli, PCR)
    • note: differential diagnosis for a “dry tap”: MF, hairy cell leukemia, bone marrow infiltration
  • biopsy: takes a sample of intact bone marrow to assess histology (architecture) and immunohistochemistry
    • only aspirates, not biopsies, can be obtained from the sternal site

Indications

• unexplained CBC abnormalities
• diagnosis and evaluation of infiltrating cancers: plasma cell disorders, leukemias, solid tumours
• diagnosis and staging of lymphoma or solid tumours
• evaluate iron metabolism and stores (gold standard, but rarely done)
• evaluate suspected deposition and storage disease (e.g. amyloidosis, Gaucher’s disease)
• evaluate fever of unknown origin, suspected mycobacterial, fungal/parasitic infections, or granulomatous disease
• evaluate unexplained splenomegaly
• confirm normal bone marrow in potential allogeneic hematopoietic cell donor

Important Considerations

• consult a hematologist prior to conducting a bone marrow biopsy on a patient with an inherited (e.g. hemophilia, vWF disease) or acquired (e.g. DIC, anticoagulant therapy, coagulopathy of liver disease, severe thrombocytopenia) bleeding diathesis to determine if pro-hemostatic therapy is indicated pre-procedure
• do not perform a bone marrow biopsy if there is evidence of infection over the targeted skin site

Left Shift
Refers to an increase in granulocyte precursors in the peripheral smear (myelocytes, metamyelocytes, promyelocytes, blasts). If present, implies increased marrow production of granulocytes (e.g. inflammation, infection, G-CSF administration, CML)

The presence of predominantly blasts in the peripheral smear with immature cells between mature neutrophils and blast suggests clonal cell disorder (MDS, acute leukemia)

If > 20% of the total WBC differential consists of blasts, this is acute leukemia and is a medical emergency
Common Presenting Problems

**Anemia**

**Definition**
- A decrease in RBC mass that can be detected by hemoglobin (Hb) concentration, hematocrit (Hct), and RBC count
  - Adult males: Hb $<$130 g/L or Hct $<$0.41%
  - Adult females: Hb $<$120 g/L or Hct $<$0.36% (changes with pregnancy and trimester)

**Clinical Features**
- **History**
  - Symptoms of anemia: fatigue, headache, light-headedness, malaise, weakness, decreased exercise tolerance, dyspnea, palpitations, dizziness, tinnitus, syncope
  - Acute vs. chronic, bleeding, systemic illness, diet (Fe, B12 sources), alcohol, family history
  - Menstrual history: menorrhagia, menometrorrhagia
  - Rule out pancytopenia (recurrent infection, mucosal bleeding, easy bruising)
- **Physical Signs**
  - HEENT: pallor in mucous membranes and conjunctiva at Hb $<$90 g/L (<9 g/dL), ocular bruits at Hb $<$55 g/L (<5.5 g/dL), angular cheilitis, jaundice
  - Cardiac: tachycardia, orthostatic hypotension, systolic flow murmur, wide pulse pressure, signs of CHF
  - Dermatologic: ecchymosis, petechiae, pallor in palmar skin creases at Hb $<$75 g/L, jaundice (if due to hemolysis), nail changes (spooning), glossitis
  - Splenomegaly, lymphadenopathy

**Investigations**
- Rule out dilutional anemia (low Hb due to increased effective circulating volume)
- CBC with differential
- Reticulocyte count and blood smear/film
- Rule out nutritional deficit, gastrointestinal and genitourinary disease in iron deficiency anemia
- Additional laboratory investigations as indicated (see [Microcytic Anemia, H13], [Normocytic Anemia, H17], [Hemolytic Anemia, H18], and [Macrocytic Anemia, H23])
- N.B. may have a mixed picture with multiple concomitant nutritional deficiencies

**Erythrocytosis**

**Definition**
- An increase in the number of RBCs: Hb $>$185 g/L or Hct $>$52% (males); Hb $>$165 g/L or Hct $>$47% (females and African males)

**Etiology**
- Relative spurious erythrocytosis (decreased plasma volume): diuretics, severe dehydration, burns, "stress" (Gaisböck’s syndrome)
- Absolute erythrocytosis
Table 5. Etiology of Erythrocytosis

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Inappropriate Production of Erythropoietin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polycythemia Vera (PV) (see Polycythemia Vera, H41)</td>
<td>Physiologic (poor tissue oxygenation/hypoxia)</td>
<td>Tumours</td>
</tr>
<tr>
<td></td>
<td>Carbon monoxide poisoning</td>
<td>Hepatocellular carcinoma</td>
</tr>
<tr>
<td></td>
<td>Heavy smoking</td>
<td>Renal cell carcinoma</td>
</tr>
<tr>
<td></td>
<td>High altitude</td>
<td>Cerebellar hemangioblastoma</td>
</tr>
<tr>
<td>Pulmonary Disease</td>
<td>COPD</td>
<td>Pheochromocytoma</td>
</tr>
<tr>
<td></td>
<td>Sleep apnea</td>
<td>Uterine leiomyoma</td>
</tr>
<tr>
<td></td>
<td>Pulmonary hypertension</td>
<td>Ovarian tumour</td>
</tr>
<tr>
<td>Cardiovascular Disease</td>
<td>R to L shunt (Eisenmenger syndrome)</td>
<td>Other</td>
</tr>
<tr>
<td></td>
<td>RBC defects (Hb with increased O₂ affinity, methemoglobinemia)</td>
<td>Polycystic kidney disease</td>
</tr>
</tbody>
</table>

Clinical Features
- secondary to high red cell mass and hyperviscosity
  - headache, dyspnea, dizziness, tinnitus, visual disturbances, hypertensive symptoms, numbness/tingling
  - symptoms of angina, congestive heart failure, aquagenic pruritus (only in MPNs)
  - thrombosis (venous or arterial) or bleeding (seen with acquired vWD or acquired platelet dysfunction in MPNs)
  - physical findings
    - splenomegaly ± hepatomegaly, facial plethora/ruddy complexion (70%) and/or palms, gout

Investigations
- serum erythropoietin (EPO): differentiates primary (low/normal) from other etiologies (elevated)
  - search for tumour as source of EPO as indicated (e.g. abdominal U/S, CT head)
  - JAK-2 mutation analysis: positive in >96% of cases of PV
    - only send if low/normal EPO level
  - ferritin (iron deficiency can mask the diagnosis; if iron deficient with reticulocytosis, suggestive of PV)

Treatment
- if primary: see Polycythemia Vera, H41
- if secondary: treat underlying cause
  - O₂ for hypoxemia, CPAP for sleep apnea, surgery for EPO-secreting tumours
  - often cardiologists will be hesitant to treat high Hct in cyanotic patients

Thrombocytopenia

Definition
- platelet count <150 x 10⁹/L

Clinical Features
- history: mucocutaneous bleeding (easy bruising, gingival bleeding), epistaxis, peri-operative bleeding (including dental procedures, heavy menstrual bleeding, peripartum bleeding)
- physical exam: bruising, petechiae, ecchymoses, non-palpable purpura, wet purpura
  - see Disorders of Primary Hemostasis, H27 for complications

Investigations
- CBC and differential
- blood film
  - rule out pseudo-thrombocytopenia (platelet clumping or platelet satellitism)
  - decreased production: other cell line abnormal ties, blasts, hypersegmented PMNs, leukoerythroblastic changes
  - increased destruction: large platelets (often seen in ITP), schistocytes (seen in MAHA/TMA)
  - workup for nutritional deficiencies: B₁₂, RBC folate
  - PT/INR, aPTT, and fibrinogen if DIC suspected
  - LFTs

Treatments
- life threatening bleeding: platelet transfusion (repeat CBC 1 h post-transfusion to confirm an appropriate rise in counts)
- if secondary: treat underlying cause
- ITP: see Immune Thrombocytopenic Purpura, H27
**Thrombocytopenia**

**Definition**
- platelet count >400 x 10⁹/L
- primary thrombocytosis (uncommon): due to myeloproliferative neoplasms (e.g. CML, polycythemia vera, primary myelofibrosis, essential thrombocytosis; rarely associated with MDS)
- reactive/secondary thrombocytosis (common): acute phase reactant (e.g. surgery, inflammation, infection, trauma, bleeding, iron deficiency, neoplasms, ischemic injury)

**Clinical Features**
- history: trauma, surgery, splenectomy, infection, inflammation, bleeding, iron deficiency, prior diagnosis of chronic hematologic disorder, constitutional symptoms (malignancy)
- vasomotor symptoms: headache, visual disturbances, lightheadedness, atypical chest pain, acral dysesthesia, erythromelalgia, livedo reticularis, aquagenic pruritus
- clotting risk, bleeding risk (rare)
- physical exam: splenomegaly can be seen in myeloproliferative neoplasms (MPNs)

**Investigations**
- CBC, peripheral blood film, serum ferritin concentration
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MPN/MDS

**Treatment**
- primary: ASA ± cytoreductive agents (e.g. hydroxyurea, anagrelide, interferon-α)
- secondary: treat underlying cause

**Pancytopenia**

**Definition**
- a decrease in all hematopoietic cell lines

**Clinical Features**
- anemia: fatigue (see Anemia, H6)
- leukopenia: recurrent infections (see Neutropenia, H9)
- thrombocytopenia: mucosal bleeding (see Thrombocytopenia, H7)

**Investigations**
- CBC, peripheral blood film, serum ferritin concentration, B₁₂, folate
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- workup as per Figure 4 and presenting symptoms/physical exam
- if reactive process has been ruled out, bone marrow biopsy may be required

*In hospitalized patients most common causes of thrombocytopenia are drugs and infection*

APS = antiphospholipid antibody syndrome; DIC = disseminated intravascular coagulation; HELLp = hemolysis, elevated liver enzymes, low platelet count; HIT = heparin induced thrombocytopenia; HUS = hemolytic uremic syndrome; ITP = idiopathic thrombocytopenic purpura; TTP = thrombotic thrombocytopenic purpura

**Figure 3. Approach to thrombocytopenia**
Adapted from: Cecil Essentials of Medicine
Neutrophilia

**Definition**
- variable definition, but generally an absolute neutrophil count (ANC) >7.7 x 10⁹/L (WHO definition)

**Etiology**
- primary neutrophilia
  - chronic myeloid leukemia (CML)
  - other myeloproliferative disorders: PV, ET, myelofibrosis
  - hereditary neutrophilia (autosomal dominant)
  - chronic idiopathic neutrophilia in otherwise healthy patients
  - leukocyte adhesion deficiency
- secondary neutrophilia
  - stress/exercise/epinephrine: movement of neutrophils from marginated pool into circulating pool
  - obesity
  - infection: leukocytosis with left shift ± toxic granulation, Döhle bodies (intra-cytoplasmic structures composed of agglutinated ribosomes)
  - inflammation: e.g. rheumatoid arthritis (RA), IBD, chronic hepatitis, MI, PE, burns
  - malignancy: hematologic (i.e. marrow invasion by tumour) and non-hematologic (especially large cell lung cancer)
  - medications: glucocorticoids, β-agonists, lithium, G-CSF

**Clinical Features**
- look for signs and symptoms of fever, inflammation, malignancy to determine appropriate further investigations
- including lymphadenopathy and organomegaly
- examine oral cavity, teeth, peri-rectal area, genitals, and skin for signs of infection

**Investigations**
- CBC and differential: mature neutrophils or bands >20% of total WBC suggests infection/inflammation
- blood film: Döhle bodies, toxic granulation, cytoplasmic vacuoles in infection
- may require bone marrow biopsy if MPN suspected

**Treatment**
- directed at underlying cause

Neutropenia

**Definition**
- mild: ANC 1.0-1.5 x 10⁹/L
- moderate: ANC 0.5-1.0 x 10⁹/L (risk of infection starts to increase)
- severe: ANC <0.5 x 10⁹/L
- profound: ANC <0.1 x 10⁹/L for >7 d

**Absolute Neutrophil Count (ANC) = WBC count x (%PMNs + %bands)
Be aware of fever + ANC <0.5 x 10⁹/L = FEBRILE NEUTROPENIA**
Etiology

<tr>
<td>Constitutinal neutropenia, benign cyclic neutropenia</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Clinical Features

- fever, chills (only if infection present)
- infection by endogenous bacteria (e.g. S. aureus, gram negatives from GI and GU tract)
- painful ulceration on skin, anus, mouth, and throat following colonization by opportunistic organisms
- avoid digital rectal exam

Investigations

- dependent on degree of neutropenia, history, and symptoms
- ranges from observation with frequent CBCs to bone marrow aspiration and biopsy

Treatment

- regular dental care: chronic gingivitis and recurrent stomatitis major sources of morbidity
- treatment of febrile neutropenia (see Infectious Diseases, ID45)
- in severe immune-mediated neutropenia, G-CSF may increase neutrophil counts
  - if no response to G-CSF, consider immunosuppression (e.g. steroids, cyclosporine, methotrexate)

Lymphocytosis

**Definition**

- absolute lymphocyte count >4.0 x 10⁹/L

**Etiology**

- infection (reactive lymphocytosis)
  - viral infections (majority); particularly mononucleosis
  - TB, pertussis, brucellosis, toxoplasmosis
  - smoking
  - physiologic response to stress (e.g. trauma, status epilepticus)
  - hypersensitivity (e.g. drugs, serum sickness)
  - autoimmune (e.g. rheumatoid arthritis)
  - neoplasm (e.g. ALL if blasts present, CLL, B cell lymphocytosis of undetermined significance)

**Investigations**

- CBC, peripheral smear assessing lymphocyte morphology

**Treatment**

- treat underlying cause
**Lymphopenia**

**Definition**
- absolute lymphocyte count <1.0 x 10⁹/L

**Etiology**
- idiopathic CD4+ lymphocytopenia
- radiation
- HIV/AIDS, hepatitis B, hepatitis C
- malignancy/chemotherapeutic agents
- malnutrition, alcoholism
- autoimmune disease (e.g. SLE)

**Clinical Features**
- opportunistic infections (see Infectious Diseases, ID34)

**Treatment**
- treat underlying cause
- treat opportunistic infections aggressively and consider antimicrobial prophylaxis (see Infectious Diseases, ID30)

---

**Eosinophilia**

**Definition**
- absolute eosinophil count >0.5 x 10⁹/L

**Etiology**
- primary: due to clonal bone marrow disorder
  - if no primary etiology identified, classified as hypereosinophilic syndrome
    - 6 mo of eosinophilia (count >1.5 x 10⁹/L) with no other detectable causes and end organ damage
    - can involve heart, bone marrow, CNS
- secondary
  - most common causes are parasitic (usually helminth) infections and allergic reactions
  - less common causes
    - collagen vascular diseases (e.g. RA, polyarteritis nodosa, see Rheumatology, RH19)
    - respiratory causes (asthma, eosinophilic pneumonia, Churg-Strauss)
    - cholesterol emboli
    - hematologic malignancy: see Chronic Myeloid Leukemia, H40 and Hodgkin Lymphoma, H45
    - adrenal insufficiency, see Endocrinology, E33
    - medications (penicillins)
    - atopic dermatitis

**Treatment**
- treat underlying cause
- ensure strongyloides serology is collected to rule out infection before initiating steroids for patients at risk

---

**Agranulocytosis**

**Definition**
- severe depletion of granulocytes (neutrophils, eosinophils, basophils) from the blood and granulocyte precursors from bone marrow

**Etiology**
- associated with medications in 70% of cases: e.g. chemotherapy, clozapine, thionamides (antithyroid drugs), sulfasalazine, and ticlopidine
  - immune-mediated destruction of circulating granulocytes by drug-induced antibodies or direct toxic effects upon marrow granulocytic precursors

**Clinical Features**
- abrupt onset of fever, chills, weakness, and oropharyngeal ulcers

**Prognosis**
- high fatality without vigorous treatment

**Investigations/Treatment**
- discontinue offending drug
- pan-culture and screen for infection if patient is febrile (blood cultures x2, urine culture, and chest x-ray as minimum, initiate broad-spectrum antibiotics)
- consider bone marrow aspirate and biopsy if cause unclear
- consider G-CSF
Leukemoid Reaction

- blood findings resembling those seen in certain types of leukemia which reflect the response of healthy BM to cytokines released due to infection or trauma
- leukocytosis >50 x 10⁹/L, marked left shift (myelocytes, metamyelocytes, bands in peripheral blood smear)

Approach to Lymphadenopathy

**History**
- constitutional/B-symptoms: seen in TB, lymphoma, other malignancies
- growth pattern: acute vs. chronic
- exposures: cats (cat scratch – *Bartonella henselae*), ticks (Lyme disease – *Borrelia burgdorferi*), high risk behaviours (HIV)
- joint pain/swelling, rashes (connective tissue disorder)
- pruritus (seen in Hodgkin lymphoma)
- medications (can cause serum sickness → lymphadenopathy)

**Clinical Features**
- determine if lymphadenopathy is localized or generalized
- localized: typically reactive or neoplastic
  - cervical (bacterial/mycobacterial infections, ENT malignancies, metastatic cancer)
  - supravclavicular
    - right (mediastinal, bronchogenic esophageal cancer)
    - left (gastric, gall bladder, pancreas, renal, testicular/ovarian cancer)
  - axillary (cat scratch fever, breast cancer, metastatic cancer)
  - epitrochlear (infections, sarcoidosis, lymphoma)
  - check for splenomegaly, constitutional symptoms

**Investigations**
- CBC and differential, blood film
- if generalized consider tuberculin test, HIV RNA, VDRL, Monospot* / EBV serology, ANA, imaging
- if localized and no symptoms suggestive of malignancy, can observe 3-4 wk (if no resolution → biopsy)
- excisional biopsy is preferred as it preserves node architecture (essential for diagnosing lymphoma)
- in areas difficult to access (retroperitoneal, mediastinal/hilar) multiple core biopsies may be more practical/feasible
- FNA should NOT be used for diagnostic purposes in lymphoproliferative disease (use excisional biopsy instead)
  - FNA is helpful for recurrence of solid tumour malignancy
  - imaging such as U/S or CT can provide more info, but generally adds little to diagnosis

The underlined conditions cause massive splenomegaly (spleen crosses midline or reaches pelvis)

History
- constitutional symptoms, feeling of fullness in LUQ, early satiety
- signs or symptoms of infection (e.g. mononucleosis) or malignancy
- history of liver disease, hemolytic anemia, or high-risk exposures

Clinical Features
- jaundice, petechiae
- signs of chronic liver disease
- percussion (Castell's sign, Traube's space, Nixon's method) and palpation
- associated lymphadenopathy or hepatomegaly
- signs of CHF

Investigations
- CBC and differential, blood film
- as indicated: liver enzymes (AST, ALT, ALP, GGT) and/or LFTs (platelet, INR, albumin, bilirubin), reticulocyte count, Monospot®/EBV, haptoglobin, LDH, infectious, and autoimmune workup
- imaging
  - ultrasound of abdomen/liver to assess for cirrhosis and portal vein thrombosis (if positive, refer to hepatology for evaluation)
  - echo for cardiac function
  - CT to rule out lymphoma and assess splenic lesions

Iron Intake (Dietary)
- average North American adult diet = 10-20 mg iron (Fe) daily
- steady state absorption is 5-10% (0.5-2 mg/d); enhanced by citric acid, ascorbic acid (vitamin C) and reduced by polyphenols (e.g. in tea), phytate (e.g. in bran), dietary calcium, and soy protein
- males have positive Fe balance; up to 20% of menstruating females have negative Fe balance
**Iron Absorption and Transport**
- dietary iron is absorbed in the duodenum (e.g. absorption impaired in IBD and Celiac disease)
- in circulation the majority of non-heme iron is bound to transferrin which transfers iron from enterocytes and storage pool sites (macrophages of the reticuloendothelial system and hepatocytes) to RBC precursors in the bone marrow

**Iron Levels**
- hepcidin is a hormone produced by hepatocytes that regulates systemic iron levels
  - binds to iron exporter ferroportin (on duodenal enterocytes and reticuloendothelial cells) and induces its degradation, thereby inhibiting iron export into circulation (diminished absorption of iron and iron trapping in reticuloendothelial system cells)
- hepcidin production is:
  - increased in states of iron overload (inhibiting additional iron absorption) and inflammation (mediating anemia of chronic inflammation through iron trapping)
  - decreased in states where erythropoiesis is increased (e.g. hemolysis) or oxygen tension is low

**Iron Storage**
- ferritin
  - ferric iron (Fe³⁺) complexed to a protein called apoferritin (hepatocytes are main ferritin storage site)
  - small quantities are present in plasma in equilibrium with intracellular ferritin
  - also an acute phase reactant – can be spuriously elevated despite low Fe stores in response to a stressor
- hemosiderin
  - aggregates or crystals of ferritin with the apoferritin partially removed
  - macrophage-monooyte system is main source of hemosiderin storage

**Iron Indices**
- bone marrow aspirate: gold standard test for assessment of iron stores (rarely done)
- serum ferritin: most important blood test for iron stores
  - decreased in iron deficiency anemia
  - elevated in infection, inflammation, malignancy, liver disease, hyperthyroidism, and iron overload
- serum iron: measure of all non-heme iron present in blood
  - varies significantly daily
  - virtually all serum iron is bound to transferrin, only a trace is free or complexed in ferritin
- total iron binding capacity (TIBC): total amount of transferrin present in blood
  - normally, one third of TIBC is saturated with iron
  - high specificity for decreased iron, low sensitivity saturation
  - serum Fe divided by TIBC, expressed as a proportion or a percentage
- soluble transferrin receptor (sTfR)
  - reflects the availability of iron at the tissue level
  - the transferrin receptor is expressed on the surface of erythroblasts and is responsible for iron uptake – some is cleaved off and is present in circulation as sTfR
  - in iron deficient states more transferrin receptor is expressed on erythroblasts leading to an increase in sTfR
  - low in reduced erythropoiesis and iron overload
  - useful in determining iron deficiency in the setting of chronic inflammatory disorders (see *Iron Deficiency Anemia*)

*Figure 5. Iron metabolism*
Iron Deficiency Anemia

- see Pediatrics, P41
- most common cause of anemia in North America

Etiology
- increased demand
  - increased physiological need for iron in the body (e.g. pregnancy)
- decreased supply: dietary deficiencies (rarely the only etiology in the developed world)
  - cow’s milk (infant diet), “tea and toast” diet (elderly), absorption imbalances, post-gastrectomy, malabsorption (IBD of duodenum, celiac disease, autoimmune atrophic gastritis, H.pylori infection)
- increased losses
  - hemorrhage
    - obvious causes: menorrhagia, abnormal uterine bleeding, frank GI bleed
    - occult: peptic ulcer disease, GI cancer
  - hemolysis
    - chronic intravascular hemolysis (e.g. PNH, cardiac valve RBC fragmentation)

Clinical Features
- iron deficiency may cause fatigue before clinical anemia develops
- signs/symptoms of anemia: see Anemia, H6
- brittle hair, nail changes (brittle, koilonychia)
- pica (appetite for non-food substances e.g. ice, paint, dirt)
- restless leg syndrome

Investigations
- iron indices, including soluble transferrin receptor
  - low ferritin (<18 µg/L) is diagnostic of iron deficiency
  - ferritin is an acute phase reactant and is elevated in the setting of inflammatory conditions and liver disease; serum ferritin <100 µg/L in these settings is suggestive of iron deficiency, necessitating further workup
- peripheral blood film
  - hypochromic microcytosis: RBCs have low Hb levels due to lack of iron
  - pencil forms, anisocytosis
  - target cells
- bone marrow (gold standard but rarely done)
  - iron stain (Prussian blue) shows decreased iron in macrophages and in erythroid precursors (sideroblasts)
  - intermediate and late erythroblasts show micronormoblastic maturation

Patient with microcytic anemia

![Figure 6. Approach to interpreting iron indices](adapted from Am Fam Physician 2007;75:871-878)

Iron deficiency anemia is a common presentation of chronic lower GI bleeds (right-sided colorectal cancer, angiodysplasia, etc.)
In males and in post menopausal women, a GI workup is always warranted (gastroscopy, colonoscopy)

Treatment
- treat underlying cause
- supplementation
  - oral (capsules, syrup)
    - ferrous sulphate 325 mg tid (65 mg elemental iron), ferrous gluconate 300 mg tid (35 mg elemental iron), or ferrous fumarate 300 mg tid (100 mg elemental iron)
  - supplement until anemia corrects, then continue for 3+ mo until serum ferritin returns to normal
  - oral iron should be taken with citrus juice (vitamin C) to enhance absorption
  - IV (iron sucrose or dextran) can be used if patient cannot tolerate or absorb oral iron
- monitoring response
  - reticulocyte count will begin to increase after one wk
  - Hb normalizes by 10 g/L per wk (if no blood loss)
Anemia of Chronic Inflammation

Etiology
- infection, malignancy, inflammatory and rheumatologic disease, chronic renal and liver disease, endocrine disorders (e.g. DM, hypothyroidism, hypogonadism, hypopituitarism)

Pathophysiology
- an anemia of underproduction due to impaired iron utilization (hepcidin is a key regulatory peptide)
  - hepatic hepcidin production is increased in inflammatory processes, trapping iron in enterocytes and macrophages (via ferroportin inhibition), see Figure 5
  - reduced plasma iron levels make iron relatively unavailable for new hemoglobin synthesis
  - marrow unresponsive to normal or slightly elevated EPO
  - mild hemolytic component is often present i.e. RBC survival is modestly decreased

Investigations
- diagnosis of exclusion
- associated with elevation in acute phase reactants (ESR, CRP, fibrinogen, platelets)
- peripheral blood
  - mild: usually normocytic and normochromic
  - moderate: may be microcytic and normochromic
  - severe: may be microcytic and hypochromic
  - absolute reticulocyte count is frequently low, reflecting overall decrease in RBC production
  - “classic” serum iron indices
    - serum iron and TIBC low, % saturation low
    - serum ferritin is normal or increased
- bone marrow
  - normal or increased iron stores
  - decreased or absent staining for iron in erythroid precursors

Treatment
- treat underlying disease
- only treat anemia in patients who can benefit from a higher hemoglobin
- IV iron if no benefit from PO iron (overcomes sequestration in enterocytes)
- erythropoietin indicated in chronic renal failure; not to be used if patient has concomitant curative solid tumour malignancy; ensure Hb target <110 g/L

Sideroblastic Anemia

uncommon compared to iron deficiency anemia or anemia of chronic disease

Sideroblasts
- erythrocytes with iron-containing (basophilic) granules in the cytoplasm
- “normal”: in healthy individuals, granules are small and randomly spread in the cytoplasm
- “ring”: iron deposits in mitochondria, forming large, abnormal granules that surround the nucleus
  - the hallmark of sideroblastic anemia

Etiology
- due to defects in heme biosynthesis in erythroid precursors
- hereditary (rare): X-linked; median survival 10 yr
- idiopathic (acquired)
  - refractory anemia with ringed sideroblasts: a subtype of MDS (see Myelodysplastic Syndromes, H39)
  - may be a preleukemic phenomenon (10% transform to AML)
- reversible
  - drugs (isoniazid, chloramphenicol), alcohol, lead, copper deficiency, zinc toxicity, hypothyroidism

Clinical Features
- anemia symptoms (see Anemia, H6)
- hepatosplenomegaly, evidence of iron overload

Investigations
- serum iron indices
  - increased serum Fe++, normal TIBC, increased ferritin, increased sTfR
- blood film/bone marrow biopsy
  - ringed sideroblasts (diagnostic hallmark)
  - RBCs are hypochromic; can be micro-, normo-, or macrocytic
  - anisocytosis, poikilocytosis, basophilic stippling
**Normocytic Anemia**

- MCV 80-100 fL
- see Figure 2, Approach to Anemia, H6

### Aplastic Anemia

**Definition**
- destruction of hematopoietic cells of the bone marrow leading to pancytopenia and hypocellular bone marrow

**Etiology**

<table>
<thead>
<tr>
<th>Congenital</th>
<th>Acquired</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fanconi’s anemia</td>
<td>Idiopathic</td>
</tr>
<tr>
<td>Shwachman-Diamond syndrome</td>

</tr>
<tr>
<td>Toxins</td>
<td>Benzene/organic solvents</td>
</tr>
<tr>
<td></td>
<td>DDTP, insecticides</td>
</tr>
</tbody>
</table>

**Clinical Features**
- can present acutely or insidiously
- symptoms of anemia (see Anemia, H6), thrombocytopenia (see Thrombocytopenia, H7), and/or infection
- ± splenomegaly and lymphadenopathy (depending on the cause)

**Investigations**
- exclude other causes of pancytopenia (see Figure 4), including PNH (overlap syndrome)
- CBC
  - anemia, neutropenia or thrombocytopenia (any combination) ± pancytopenia
  - decreased reticulocytes (<1% of the total RBC count) blood film
  - decreased number of normal RBCs
- bone marrow
  - aplasia or hypoplasia of marrow cells with fat replacement
  - decreased cellularity

**Treatment**
- remove offending agents
- supportive care (red cell and platelet transfusions, antibiotics)
  - judicious use so as to not increase the risk of immune sensitization to blood products
- immunosuppression (for idiopathic aplastic anemia)
  - anti-thymocyte globulin: 50-60% of patients respond
  - cyclosporine
- allogeneic bone marrow transplant
- growth factors: e.g. Eltrombopag (TPO receptor agonist), G-CSF, and EPO not effective

### Lead Poisoning

**Definition/Etiology**
- blood lead levels greater than 80 µg/dL, possible symptomatology at 50 µg/dL
- identify source: consider occupational history, exposures history, utensil history

**Clinical Features**
- abdominal pain, constipation, irritability, difficulty concentrating

**Treatment**
- chelation therapy: dimercaprol and EDTA are first line agents

### Causes of Normocytic Anemia

**ABCD**
- Acute blood loss
- Bone marrow failure
- Chronic disease
- Destruction (hemolysis)
Hemolytic Anemia

Definition
- anemia due to a shortened survival of circulating RBCs, usually defined as <100 d
- uncommon cause for anemia (<5% of cases) with many etiologies (>200)

Classification
- hereditary
  - abnormal membrane (spherocytosis, elliptocytosis)
  - abnormal enzymes (pyruvate kinase deficiency, G6PD deficiency)
  - abnormal hemoglobin synthesis (thalassemias, hemoglobinopathies)
- acquired
  - immune
    - autoimmune: warm vs. cold autoimmune hemolytic anemias (AIHA), see Table 14 Classification of AIHA, H22
    - alloimmune: hemolytic disease of the fetus/newborn, post-transfusion
  - non-immune
    - MAHA/TMA, now known as TMA: thrombus in blood vessel causes RBCs to be sheared associated with DIC, HUS, aHUS, TTP, preeclampsia/HELLP, vasculitides, malignant hypertension
    - other causes: PNH, hypersplenism, march hemoglobinuria (exertional hemolysis), infection (e.g. malaria), snake venoms, mechanical heart valves
- also classified as intravascular or extravascular
  - intravascular: MAHA/TMA (e.g. TTP DIC), infections (malaria, Clostridium), and PNH
  - extravascular: RBCs are coated with antibodies (AIHA) or have an abnormal membrane structure/shape or inclusions

Clinical Features Specific to HA
- jaundice
- dark urine (hemoglobinuria, bilirubin)
- cholelithiasis (pigment stones)
- potential for an aplastic crisis (i.e. BM suppression in overwhelming infection)
- iron overload with extravascular hemolysis
- iron deficiency with intravascular hemolysis

Investigations

Table 12. Investigations for Hemolytic Anemia

<table>
<thead>
<tr>
<th>Screening Tests</th>
<th>Tests Specific For Intravascular Hemolysis</th>

</tr>
<tr>
<td>Reticulocytosis</td>
<td>Hemoglobinuria (delayed) – most sensitive</td>
</tr>
</tbody>
</table>

Tests Specific for Extravascular Hemolysis

Direct Antiglobulin Test (direct Coombs)
- Detects IgG or complement on the surface of RBC
- Add anti-IgG or anti complement Ab to patient’s RBCs; positive if agglutination
- Indications: hemolytic disease of newborn, AIHA, hemolytic transfusion reaction

Indirect Antiglobulin Test (indirect Coombs)
- Detects an antibodies in serum that can recognize antigens on RBCs
- Mix patient’s serum + donor RBCs + Coombs serum (anti-human Ig Ab); positive if agglutination
- Indications: cross-matching donor RBCs, atypical blood group, blood group Ab in pregnant women, AIHA

Thalassemia

Definition
- defects in production of the α or β chains of hemoglobin
  - resulting imbalance in globin chains leads to ineffective erythropoiesis and hemolysis in the spleen or BM
  - clinical manifestations and treatment depends on specific gene and number of alleles affected
- common features
  - increasing severity with increasing number of alleles involved
  - hypochromic microcytic anemia
  - basophilic stippling, abnormally shaped RBCs on blood film

Thalassemia

- β-Thal: prevalent in Mediterranean
- α-Thal: prevalent in South East Asia (SEA) and Africa (α = Asia, Africa)
Pathophysiology
- defect may be in any of the Hb genes
  - normally 4α genes in total; 2 on each copy of chromosome 16
  - normally 2β genes in total; 1 on each copy of chromosome 11
  - fetal hemoglobin (HbF, α2γ2), switches to adult forms HbA (α2β2) and HbA2 (α2δ2) at 3-6 mo of life
- HbA constitutes 97% of adult hemoglobin
- HbA2 constitutes 3% of adult hemoglobin

β-Thalassemia Minor (Thalassemia Trait)

Definition
- defect in single allele of β gene (heterozygous for one normal β globin allele and one β globin thalassemic allele)
- common in people of Mediterranean and Asian descent

Clinical Features
- usually asymptomatic; a palpable spleen is very rare

Investigations
- Hb (100-140 g/L), MCV (<70 fL), Fe (normal), RBC count (normal)
- peripheral blood film – microcytosis basophilic stippling
- HB electrophoresis
  - specific: HbA2 increased to 3.5-5% (normal 1.5-3.5%)
  - non-specific: 50% have slight increase in HbF

Treatment
- no treatment required
- genetic counselling for patient and family

β-Thalassemia Major

Definition
- defect in both alleles of β gene (homozygous, autosomal recessive)

Pathophysiology
- ineffective chain synthesis leading to ineffective erythropoiesis, hemolysis of RBCs, and increase in HbF

Clinical Features
- initial presentation at age 6-12 mo when HbA (α2/β2) normally replaces HbF (α2/γ2)
  - severe anemia, jaundice
  - iron overload progressing to hemochromatosis
    - secondary to repeated transfusions and ineffective erythropoiesis
    - leads to iron-induced organ damage
  - stunted growth and development (hypogonadal dwarf)
  - gross hepatosplenomegaly (due to extramedullary hematopoiesis)
  - radiologic changes (due to expanded marrow cavity) and extramedullary hematopoietic masses (erythroid tissue tumours)
    - skull x-ray has “hair-on-end” appearance
    - pathologic fractures common
  - evidence of increased Hb catabolism (e.g. pigmented gallstones)
  - death can result from
    - untreated anemia (should transfuse)
    - infection (should identify and treat early)
    - iron overload (common); late complication from repeated transfusions and ineffective erythropoiesis

Investigations
- severe microcytic anemia (Hb <60 g/L)
- peripheral blood film: teardrop, target, hypochromatic, microcytic
- HB electrophoresis
  - HbA: 0-10% (normal >95%)
  - HbA2 >2.5%
  - HbF: 90-100%

Treatment
- lifelong regular transfusions to suppress endogenous erythropoiesis
- iron chelation (e.g. deferoxamine, deferasirox, deferiprone) to prevent iron overload in organs and the formation of free radicals (which promote tissue damage and fibrosis)
- folic acid supplementation if not transfused
- allogeneic bone marrow transplantation (potentially curative) or cord blood transplant
- splenectomy (now performed less frequently)
**β-Thalassemia Intermedia**

**Definition**
- clinical diagnosis in patients whose clinical manifestations are too mild to be classified as thalassemia major, but too severe to be classified as thalassemia minor

**Clinical Features**
- wide variety of clinical phenotypes
- in most cases of TI, both β-globin genes affected
- three main mechanisms account for the milder phenotype compared to thalassemia major: (1) subnormal (vs. absent) β-chain synthesis, (2) increased number of γ chains, (3) coinheritance of α thalassemia (in some cases)
- complications more commonly seen in TI than thalassemia major include extramedullary hematopoiesis, leg ulcers, gallstones, thrombosis, and pulmonary hypertension, and growth retardation

**α-Thalassemia**

**Definition**
- defect(s) in α genes
- similar geographic distribution as β-thalassemia, but higher frequency among Asians and Africans

**Clinical Features**
- 1 defective α gene (aa/a-): clinically silent; normal Hb, normal MCV
- 2 defective α genes (cis: aa/-- or trans: a/a-): decreased MCV, normal Hb
  - N.B. cis 2-gene deletion more common in Asia vs. trans 2-gene deletion more common in Africa – this leads to increased risk of fetal hydrops in offspring of Asian patients vs. African patients
- 3 defective α genes (a-/-): HbH (β4) disease; presents in adults, decreased MCV, decreased Hb, splenomegaly
- 4 defective α genes (--/--): Hb Barts (γ4) disease (hydrops fetalis); usually incompatible with life

**Investigations**
- peripheral blood film – screen for HbH inclusion bodies with supravital stain
- electrophoresis can be used to identify HgH disease, definitive diagnosis with DNA genotyping

**Treatment**
- depends on degree of anemia, referral for genetic/prenatal counselling
  - 1 or 2 defective α genes: no treatment required
  - HbH disease: similar to β-thalassemia intermedia
  - HbBarts: no definitive treatment, majority of pregnancies terminated (fetal/maternal mortality risk), intrauterine transfusion, stem cell transplants

**Sickle Cell Disease**

**Definition**
- autosomal recessive sickling disorders arise due to a mutant β-globin chain, most commonly caused by a Glu → Val substitution at position 6 (chromosome 11) resulting in HbS variant, rather than HbA (normal adult Hb)
- increased incidence of HbS allele with African or Mediterranean heritage (thought to be protective against malaria)
- sickle cell disease occurs when an individual has two HbS genes (homozygous, HbSS) or one HbS gene + another mutant β-globin gene (compound heterozygote) – most commonly HbS-β-thal and HbSC disease

**Pathophysiology**
- at low pO2, deoxy HbS polymerizes leading to rigid crystal-like rods that distort membranes → ‘sickles’
- the pO2 level at which sickling occurs is related to the percentage of HbS present
- sickling aggravated by acidemia, increased CO2, increased 2,3-DPG, fever, and osmolality
- fragile sickle cells then cause injury in two main ways
  1. fragile sickle cells hemolyze (nitric oxide depletion)
  2. occlusion of small vessels (hypoxia, ischemia-reperfusion injury)

**Clinical Features**
- HbAS (sickle cell trait): patient will be asymptomatic except during extreme hypoxia or infection increased risk of renal medullary carcinoma
- SCD-SS (HbSS)
  - chronic hemolytic anemia
  - jaundice in the first yr of life
  - retarded growth and development ± skeletal change
  - splenomegaly in childhood; splenic atrophy in adulthood

---

**Figure 7. Pathophysiology of sickling**

- Blood flow slows
- pO2 decreases
- Blood viscosity increases
- Distorted RBC sickle cells
- Deoxy Hb S polymers
- Impaction
- Infarction
- Hb S
  - ↑ H+
  - ↑ CO2

**Functional asplenism:** increased susceptibility to infection by encapsulated organisms
- S. pneumoniae
- N. meningitidis
- H. influenzae
- Salmonella (osteomyelitis)
SCD-SS often presents with acute pain episode
1. aplastic crises
   • toxins and infections (especially parvovirus B19) transiently suppress bone marrow
2. splenic sequestration crises
   • usually in children; significant pooling of blood in spleen resulting in acute Hb drop and shock
   • uncommon in adults due to asplenia from repeated infarction
3. vaso-occlusive crises (infarction)
   • may affect various organs causing ischemia-reperfusion injury (especially in back, chest, abdomen, and extremities), fever, and leukocytosis
   • can cause a stroke or a silent myocardial infarction
   • precipitated by infections, dehydration, rapid change in temperature, pregnancy, menses, and alcohol
4. acute chest syndrome

SCD-SC (most common compound heterozygote)
• 1:833 live births in African-Americans, common in West Africa
• milder anemia than HbSS
• similar complications as HbSS, although typically milder and less frequent (exception is proliferative sickle retinopathy, glomerulonephritis, and avascular necrosis)
• spleen not always atrophic in adults

Investigations
• sickle cell prep (detects sickling of RBCs under the microscope in response to O2 lowering agent): determines the presence of a HbS allele, but does not distinguish HbAS from HbSS
• Hb electrophoresis distinguishes HbAS, HbSS, HbSC, and other variants
• all newborns in developed countries typically screened for SCD

Table 13. Investigations for Sickle Cell Disease

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Treatment
• genetic counselling
• HbAS: no treatment required
• HbSC: treatment as per HbSS, but is dictated by symptom severity
• HbSS
  1. folic acid to prevent folate deficiency
  2. hydroxyurea to enhance production of HbF
     • mechanism of action: stops repression of Hb-γ chains and/or initiates differentiation of stem cells in which this gene is active
     • presence of HbF in the SS cells decreases polymerization and precipitation of HbS
     • N.B. hydroxyurea is cytotoxic and may cause bone marrow suppression
  3. treatment of vaso-occlusive crisis
     • supportive care: oxygen, hydration (reduces viscosity), correct acidosis, analgesics/opiates
     • indication for exchange transfusion: Hb <50-60 g/L, SCD complications (acute chest syndrome, aplastic crisis, hepatic or splenic sequestration, stroke), prevention of complications, pre-operative
     • less routinely: antimicrobials for suspected infection
  4. prevention of crises
     establish diagnosis
     • avoid conditions that promote sickling (hypoxia, acidosis, dehydration, fever)
     • vaccination in childhood (pneumococcus, meningococcus, H. influenzae b)
     • prophylactic penicillin (age 3 mo-5 yr)
     • good hygiene, nutrition, and social support
  5. screen for complications
     • regular blood work (CBC, reticulocytes, iron indices, BUN, LFTs, creatinine)
     • urinalysis annually (proteinauria, glomerulopathy)
     • transcranial doppler annually until 16 yr old (stroke prevention)
     • retinal examinations annually from 8 yr old (screen for retinopathy)
     • echocardiography once in late childhood/early adulthood (screen for pulmonary hypertension)

NIH Consensus Development Conference
Statement: Hydroxyurea Treatment for Sickle Cell Disease
Ann Intern Med 2000;143:92-938

Efficacy: Strong evidence for adolescents and adults and there is emerging data supporting its use in children. In the single RCT, the Hb level was higher in hydroxyurea recipients than placebo recipients at 2 yr (difference, 6 g/L), as was HbF (absolute difference, 3.2%). The median number of painful crises was 44% lower than in the placebo arm. The 12 observational studies that enrolled adults reported a relative increase in HbF of 4-20% and a relative reduction in crisis rates by 68-84%. Hospital admissions declined by 18-32%.

Effectiveness: Data is limited. It seems to be highly effective but is currently underutilized.

Short-Term Harms (within 6 mo): Dose-related leukopenia, thrombocytopenia, anemia, and decreased reticulocyte count. Others include decreased sperm production and dry skin.

Long-Term Harms: Birth defects in offspring of people receiving the drug, growth delays in children receiving the drug, and cancer in both children and adults who receive the drug.
Autoimmune Hemolytic Anemia

Microangiopathic Hemolytic Anemia
Thrombotic Microangiopathy

**Definition**
- hemolytic anemia due to intravascular fragmentation of RBCs

**Etiology**
- see Thrombotic Thrombocytopenic Purpura and Hemolytic Uremic Syndrome, H30
- see Disseminated Intravascular Coagulation, H32
- eclampsia, HELLP syndrome, AFLP (see Obstetrics, OB25)
- malignant hypertension
- vasculitis
- malfunctioning heart valves
- metastatic carcinoma
- drugs (calcineurin inhibitors, quinine, simvastatin)
- infections (severe CMV or meningococcus)
- catastrophic antiphospholipid antibody syndrome

**Investigations**
- blood film: evidence of hemolysis, schistocytes
- hemolytic workup
- urine: hemosiderinuria, hemoglobinuria

Hereditary Spherocytosis

- most common type of hereditary hemolytic anemia
- abnormality in RBC membrane proteins (e.g. spectrin)
  - spleen makes defective RBCs more spherocytotic (and more fragile) by membrane removal; also acts as site of RBC destruction
- autosomal dominant with variable penetrance

**Investigations**
- blood film (shows spherocytes), osmotic fragility (increased), molecular analysis for spectrin gene

**Treatment**
- in severe cases, splenectomy and vaccination against pneumococcus, meningococcus, and H. influenza b (avoid in early childhood)
Hereditary Elliptocytosis

Definition/Etiology
- abnormality in spectrin interaction with other membrane proteins
- autosomal dominant
- 25-75% elliptocytes
- hemolysis is usually mild

Treatment
- immunizations; splenectomy for severe hemolysis

Glucose-6-Phosphate Dehydrogenase Deficiency

Definition
- deficiency in glucose-6-phosphate dehydrogenase (G6PD), corresponding to a lack of reduced glutathione (GSH) and leading to RBC sensitivity due to oxidative stress

Pathophysiology
- X-linked recessive, prevalent in individuals of African, Asian, and Mediterranean descent

Clinical Features
- frequently presents as episodic hemolysis precipitated by:
  - oxidative stress
  - drugs (e.g. sulfonamide, antimalarials, nitrofurantoin)
  - infection
  - food (fava beans)
- in neonates: can present as prolonged, pathologic neonatal jaundice

Investigations
- neonatal screening
- G6PD assay (may not be useful if result is normal)
  - should not be done in acute crisis when reticulocyte count is high (reticulocytes have high G6PD levels)
- blood film
  - Heinz bodies (granules in RBCs due to oxidized Hb); passage through spleen results in the generation of bite cells
  - may have features of intravascular hemolysis (e.g. RBC fragments)

Treatment
- folic acid
- stop offending drugs and avoid triggers
- transfusion in severe cases

Macrocytic Anemia

- MCV >100 fL
- see Figure 2. Approach to Anemia, H6

<table>
<thead>
<tr>

<td>Reflects membrane abnormality with abnormal cholesterol metabolism</td>
</tr>
</tbody>
</table>

Causes of Macrocytic Anemia
- ABCDEF
  - Alcoholism (liver disease)
  - B12 deficiency
  - Compensatory reticulocytosis
  - Drugs (cytotoxic, AZT/Dysplasia
  - Endocrine (hypothyroidism)
  - Folate deficiency/Fetus (pregnancy)

Characteristics of Megaloblastic Macrocytic Anemia
- Pancytopenia
- Hypersegmented neutrophils
- Megaloblastic bone marrow
Vitamin B₁₂ Deficiency

- B₁₂ (cobalamin) see Family Medicine, Nutrition, FM6
- binds to intrinsic factor (IF) secreted by gastric parietal cells
- absorbed in terminal ileum
- total body stores sufficient for 3-4 yr

Etiology

<table>
<thead>
<tr>
<th>Diet</th>
<th>Gastric</th>
<th>Intestinal Absorption</th>
<th>Genetic</th>
</tr>
</thead>
<tbody>

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>vitamin, metformin</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Pathophysiology of Pernicious Anemia
auto-antibodies produced against gastric parietal cells leading to achlorhydria and lack of intrinsic factor secretion
- intrinsic factor is required to stabilize B₁₂ as it passes through the bowel
- decreased intrinsic factor leads to decreased ileal absorption of B₁₂
- may be associated with other autoimmune disorders (polyglandular endocrine insufficiency)
- most common in Northern European Caucasians, usually >30 yr old (median age of 60 yr old)

Clinical Features
- neurological (severity of anemia and neurological sequelae depends on deficiency)
  - peripheral neuropathy (variable reversibility)
  - usually symmetrical, affecting lower limbs more than upper limbs
  - cord (irreversible damage)
  - subacute combined degeneration
    - posterior columns: decreased vibration sense, proprioception, and 2-point discrimination, parasthesia
    - pyramidal tracts: spastic weakness, ataxia
  - cerebral (common, reversible with B₁₂ therapy)
  - confusion, delirium, dementia
  - cranial nerves (rare)
  - optic atrophy

Investigations
- CBC, reticulocyte count
  - anemia often severe ± neutropenia ± thrombocytopenia
  - MCV >110 fl
  - low reticulocyte count relative to the degree of anemia (<2%)
- serum B₁₂ and RBC folate
  - caution: low serum B₁₂ leads to low RBC folate because of failure of folate polyglutamate synthesis in the absence of B₁₂
  - alternatively, can measure elevated urine metabolites (methylmalonate, homocysteine)
- blood film
  - oval macrocytes, hypersegmented neutrophils
- bone marrow
  - hypercellularity
  - nuclear-cytoplasmic asynchrony in RBC precursors (less mature nuclei than expected from the development of the cytoplasm)
- bilirubin and LDH
  - elevated unconjugated bilirubin and LDH due to breakdown of cells in BM
- Schilling test (radiolabeled B₁₂ test, rarely done) to distinguish pernicious anemia from other causes
  - anti-intrinsic factor antibody, anti-parietal cell antibody

Treatment
- vitamin B₁₂ 1,000 µg IM or 1,000-1,200 µg PO if intestinal absorption intact, route and duration depends on cause
- less frequent, higher doses may be as effective (e.g. 1,000 µg IM q3mo)
- watch for hypokalemia and rebound thrombocytosis when treating severe megaloblastic anemia

Oral Vitamin B₁₂ vs. Intramuscular Vitamin B₁₂ for Vitamin B₁₂ Deficiency
Cochrane DB Syt Rev 2005;3:CD004655
Study: Systematic review. 2 RCTs met inclusion criteria; total 108 patients with follow-up from 90 d-4 mo.
Intervention: One study evaluated 1,000 µg of oral B₁₂ compared to 1,000 µg IM B₁₂ on the same dosing schedule. The other compared 2,000 µg daily oral B₁₂ to 1,000 µg IM B₁₂ on a less frequent dosing schedule. Neurological and hematological end points were evaluated.
Results: Meta-analysis was not attempted due to study heterogeneity. Both studies reported improvements in hematological and neurological end points in both oral and IM groups. No significant difference was observed between groups in either study.
Conclusions: Limited data suggests high dose oral vitamin B₁₂ (1,000-2,000 µg) is equivalent to IM vitamin B₁₂ on the same or less frequent dosing schedule. This data is limited by small sample sizes and short follow-up periods. However, it suggests that a 3 to 4 month trial of oral supplementation is a reasonable first choice for patients with B₁₂ deficiency.

Schilling Test

Part 1
- Tracer dose (1 µg) of radiolabeled B₁₂, given PO
- Flowing dose (1 mg) of unlabeled B₁₂ IM 1 h later to saturate tissue binders of B₁₂, thus allowing radioactive B₁₂ to be excreted in urine
- 24 h urine radiolabeled B₁₂ measured
- Normal >5% excretion (a normal excretion will only be seen if the low B₁₂ was due to dietary deficiency)

Part 2
- Same as part 1, but radiolabeled B₁₂ given with oral intrinsic factor
- Should be done only if first stage shows reduced excretion
- Normal test result (≥5% excretion) = pernicious anemia
- Abnormal test result (<5% excretion) = intestinal causes (malabsorption)
Folate Deficiency

- uncommon in developed countries due to extensive dietary supplementation (enriched in flour)
- folate stores are depleted in 3-6 mo
- folate commonly found in green, leafy vegetables and fortified cereals

Etiology

<table>
<thead>
<tr>
<th>Diet/Deficiency</th>
<th>Malabsorption</th>
<th>Drugs</th>
<th>Increased Demand</th>
</tr>
</thead>
<tbody>

<tr>
<td></td>
<td></td>
<td></td>
<td>Hemodialysis</td>
</tr>
</tbody>
</table>

Clinical Features

- anemia, mild jaundice, glossitis, diarrhea, confusion, pallor
- unlike B12 deficiency, folate deficiency has no neurologic manifestations
- consider social history, alcohol/drug abuse, very poor diet (e.g. elderly, depressed)

Investigations

- similar to B12 deficiency (CBC, reticulocytes, blood film, RBC folate, serum B12)
- if decreased RBC folate, rule out B12 deficiency as cause

Management

- folic acid 1-5 mg PO OD x 1-4 mo; then 1 mg PO OD maintenance if cause is not reversible

Hemostasis

1. Primary Hemostasis

- cellular defense – involves the platelet and vWF predominantly
- goal is rapid cessation of bleeding; main effect is on mucocutaneous bleeding
- vessel injury results in collagen/subendothelial matrix exposure and release of vasoconstrictors
- blood flow is impeded and platelets come into contact with damaged vessel wall (Figure 11a)
  - adhesion: platelets adhere to subendothelium via von Willebrand factor (vWF)
  - activation: platelets are activated resulting in change of shape and release of ADP and thromboxane A2
  - aggregation: these factors further recruit and aggregate more platelets resulting in formation of localized hemostatic plug

2. Secondary Hemostasis

- platelet plug is reinforced by production of fibrin clot (Figure 11b)
- extrinsic (initiation) pathway: initiation of coagulation in vivo
- intrinsic (amplification) pathway: amplification once coagulation has started via positive feedback
- both intrinsic and extrinsic pathways converge onto the common pathway which results in thrombin generation and fibrin formation

3. Fibrin Stabilization

- conversion from soluble to insoluble and stable clot

4. Fibrinolysis

- once healing initiated, clot dissolution via action of the fibrinolytic system

Never give folate alone to an individual with megaloblastic anemia because it will mask B12 deficiency and neurological degeneration will continue

Normal hemostasis occurs as a result of the balance between procoagulant and anticoagulant factors

Phases of Hemostasis

- Primary hemostasis
  Vascular response and platelet plug formation via vWF
- Secondary hemostasis
  Fibrin clot formation
- Fibrin stabilization
  Fibrinolysis

<td>Hemarthroses, hematomas</td>
</tr>
</tbody>
</table>

Tests of Secondary Hemostasis

- PT/INR: Tennis is played outside (Extrinsic pathway)
- PTT: Tennis is played inside (Intrinsic pathway)

Causes of an Prolonged PTT Without Bleeding include:
1. Early contact factor (Factor XII, HMWK, PK) deficiency
2. Lupus anticoagulant
3. Inappropriate blood draw
4. Heparin contamination
5. Erythrocytosis (laboratory artifact)

Consider PTT
- IV heparin, argatroban monitoring
- Hemophilia A/B, factor XI deficiency, severe vWF
### Disorders of Primary Hemostasis

#### Definition
- Inability to form an adequate platelet plug due to
  - Disorders of blood vessels
  - Disorders of platelets: abnormal function/numbers
  - Disorders of vWF

#### Terminology of ITP
- Primary: isolated thrombocytopenia (platelet count <100x10⁹/L) with no other cause of thrombocytopenia
- Secondary: thrombocytopenia associated with another condition (e.g. HIV, HCV, SLE, CLL)
- Drug-induced: drug-dependent platelet antibodies causing platelet destruction

#### Consider PT/INR
- Warfarin
- Liver disease
- Risk factor for vitamin K deficiency (e.g. malabsorption, cholestasis, malnutrition)

#### Consider both PTT and PT/INR
- Suspected DIC
- Trauma patient, or requiring massive transfusion protocol
- Bleeding patient
- Patient receiving thrombolytic therapy

#### Drugs Associated with Thrombocytopenia
- TMP-SMX
- Heparin
- NSAIDs
- Vancomycin
- Digezin
- Acetaminophen
- Rifampin
- Amiodarone
- Ethanol
- Ethambutol
- Guanidine
- H-antagonists
- Amphotericin B
- Quinidine
**Classification of primary ITP**
- acute: newly diagnosed (diagnosis to 3 mo)
- persistent: 3-12 mo from diagnosis
- chronic >12 mo
- refractory: post-splenectomy

**Pathophysiology**
- primary or secondary ITP
  - an acquired immune-mediated disorder (pathophysiology incompletely understood)
    - anti-platelet antibodies bind to platelet surface → increased splenic clearance
    - impaired platelet production
    - helper T-cell and cytotoxic T-cell activation also implicated in platelet destruction

**Clinical Presentation**
- variable presentation: asymptomatic, fatigue, minimal bruising, mucocutaneous bleed, intracranial bleed
- assess for symptoms/signs suggesting a secondary cause

**Investigations**
- CBC and reticulocyte count: thrombocytopenia
- PT and aPTT: normal
- peripheral blood film: decreased platelets, giant platelets (rule out platelet clumping)
- HIV, HCV, H. pylori serology
- vitamin B12, ANA, C3, C4, depending on clinical symptoms
- bone marrow aspirate and biopsy: increased number of megakaryocytes
  - recommended in patients >60 yr of age, pre-splenectomy or have failed traditional ITP therapy, those with systemic symptoms, an abnormal blood film
- bone marrow aspirate and biopsy should be considered if there is any suspicion of diminished bone marrow function (e.g. myelodysplasia, infiltration)

**Treatment**
- rarely indicated if platelets >30 x 10⁹/L unless active bleeding, trauma, or surgery
- emergency treatment (active bleeding [CNS, GI, or GU] or in need of emergency surgery)
  - general measures: stop drugs that reduce platelet function, control blood pressure, minimize trauma
  - corticosteroids: prednisone (1 mg/kg) or dexamethasone (40 mg PO x 4 d)
  - antifibrinolytic: tranexamic acid (1 g PO tid or 1 g IV q6h) if mucosal bleeding
  - IVIg 1 g/kg/d x 2 doses
  - platelet transfusion: for refractory, major bleeding or need for urgent surgery (expect that platelet recovery will be diminished)
  - emergency splenectomy: may be considered, vaccinations prior if possible (pneumococcus, meningococcus, H. influenzae b)
  - management of intracranial bleeding: IV steroids, IVIg, platelets
- non-urgent treatment (Platelet count <20-30 x 10⁹/L and no bleeding)
  - 1st line
    - corticosteroids (dexamethasone 40 mg qd x 4 d x 1-4 cycles (not wk) or prednisone x 3 wk then taper)
    - IVIg
    - anti-D: appropriate for Rh+ non-splenectomized patients, but can cause hemolysis (avoid if low Hb at baseline or if DAT is positive)
  - 2nd line
    - splenectomy (need vaccinations prior to splenectomy: pneumococcus, meningococcus, H. influenzae b)
    - rituximab
  - 3rd line
    - thrombopoietin (TPO) receptor agonists (romiplostim, eltrombopag) – may be considered for second line therapy if funding available
    - immunomodulating therapy (azathioprine, cyclophosphamide, danazol, vincristine)

**Definitions of Response to Treatment**
- complete response: platelet >100
- partial response: platelet 30-100
- no response: platelet <30

**Prognosis**
- ~20% will not attain a hemostatic platelet count after first and second line therapy
- fluctuating course
- overall relatively benign, life-expectancy similar to general population (however, risk of mortality from bleeding/infection increases with advancing age)
- major concern is spontaneous intracranial hemorrhage if platelet <5 x 10⁹/L, more common in the elderly
Table 22. Heparin-Induced Thrombocytopenia (HIT)

| Pathophysiology | Immune mediated Ab recognizes a complex of heparin and platelet factor 4 (PF4) leading to platelet activation via platelet Fc receptor and activation of coagulation system |
| Diagnosis | Suspected with intermediate or high probability HIT Score (Table 23) Confirm with ELISA testing and SRA testing |
| Onset of Decreased Platelets | 5-15 d (if previously exposed to heparin within 100 d, HIT can develop in hours due to an anamnestic response) |
| Risk of Thrombosis | ~30% to 50% (25% of events are arterial) |
| Clinical Features | Venous thrombosis: DVT, PE, limb gangrene, cerebral sinus thrombosis Arterial thrombosis: MI, stroke, acute limb ischemia, organ infarct (mesentery, kidney) Heparin-induced skin necrosis (with LMWH) Acute platelet activation syndromes: acute inflammatory reactions (e.g. fever/chills, flushing, etc.) Transient global amnesia (rare) |
| Specific Tests | Re test clinical scoring models can help rule-out HIT: 4-Ts (see Table 23) and the HIT Expert Probability (HEP) score 14C serotonin release assay (uses donor platelets with 14C serotonin and heparin with patient’s plasma) ELISA for HIT-Ig (more sensitive, less specific than serotonin assay) Ultrasound of lower limb veins for DVT |
| Management | Clinical suspicion of HIT should prompt discontinuation of heparin and LMWH (specific tests take several days) Initiate anticoagulation with a non-heparin anticoagulant: e.g. argatroban, danaparoid, fondaparinux, bivalirudin unless there is a strong contraindication (duration of treatment at least 2-3 mo if no thrombotic event, and at least 3-6 mo if thrombotic event has occurred) Warfarin should only be restarted when platelet count >150 x 10^9/L Allergy band and alert in patient records |

| **Etiology** | Deficiency of metalloproteinase that breaks down ultra-large vWF multimers: ADAMTS13  
Congenital (genetic absence of ADAMTS-13)  
Acquired (drugs, malignancy, transplant, HIV-associated, idiopathic) | Shiga toxin (E. coli serotype O157:H7) in 90%  
Other bacteria, viruses, genetic causes, drugs |
| **Clinical Features** | 1. Thrombocytopenia  
2. MAHA/TMA  
3. Neurological symptoms: headache, confusion, focal defects, seizures  
4. Symptoms can be mild and non-specific | 1. Severe thrombocytopenia  
2. MAHA/TMA  
3. Acute kidney injury  
4. Bloody Diarrhea  
5. GI prodrome |
| **Investigations (both TTP, HUS)** | CBC and blood film: decreased platelets and schistocytes  
PT, aPTT, fibrinogen: normal  
Markers of hemolysis: increased unconjugated bilirubin, increased LDH, decreased haptoglobin  
Negative Coombs test | Creatinine and urea to follow renal function  
ADAMTS-13 gene, activity or inhibitor testing (TTP) |
| **Management** | Medical emergency  
Plasma exchange ± steroids  
Platelet transfusion avoided unless life-threatening bleed (associated with microvascular thrombosis)  
Plasma infusion if plasmapheresis is not immediately available | Supportive therapy (fluids, RBC transfusion, nutrition, etc.)  
Some evidence for plasma exchange  
Possible role of Eculizumab (C5 antibody blocks complement activation) for neurologic symptoms |

Note: atypical HUS is a complex disease with different etiology, treatment depends on genetic abnormalities.

von Willebrand Disease

**Pathophysiology**
- Most common inherited bleeding disorder (prevalence of 1%)
- Usually autosomal dominant (type 3 is autosomal recessive)
- Qualitative defect or quantitative deficiency of vWF depending on type
  - vWF needed for platelet adhesion/aggregation and acts as chaperone for Factor VIII (extending its half-life in circulation), therefore abnormality of vWF can affect both primary and secondary hemostasis
  - vWF exists as a series of multimers ranging in size
    - largest multimers are most active in mediation of platelet adhesion/aggregation
    - both large and small multimers complex with Factor VIII
    - vWF levels vary according to blood group (non-group O patients have higher levels than group O patients)

**Classification**
- Type 1: mild quantitative defect (decreased amount of vWF and proportional decrease in vWF activity) – 80% of cases
- Type 2: qualitative defect (vWF activity disproportionately lower than quantity) – 20% of cases
- Type 3: severe total quantitative defect (virtually no vWF produced), 1 per million

**Clinical Features**
- Bleeding history is the single most important predictor of an underlying bleeding disorder
- Validated, standardized bleeding assessment tools (e.g. ISTH-BAT) to facilitate exploration of the bleeding history
- Mucocutaneous bleeding (easy bruising, epistaxis, heavy menstrual bleeding, peripartum bleeding, post-dental extraction bleeding, post-operative bleeding, gastrointestinal bleeding)
- Type 3 vWD patients can experience musculoskeletal bleeding due to significant deficiency in FVIII due to lack of FVIII chaperoning as vWF is absent

**Investigations**
- CBC, platelet, vWF:Antigen (determine how much vWF is present), vWF:Ristocetin cofactor activity (determine how well vWF bind to platelet), Factor VIII (determine how well vWF chaperon with FVIII), PT
- Tests to further categorize type/subtype of vWD: multimer analysis, ristocetin induced platelet agglutination, genetic studies
Table 25. Investigations in vWD

**Treatment**
- desmopressin (DDAVP®) is effective treatment for 85-90% of patients with type 1 vWD and for some subtypes of type 2 vWD
  - causes release of vWF and Factor VIII from endothelial cells
  - variable efficacy depending on disease type; tachyphylaxis occurs after 4 consecutive doses
  - need to document responsiveness with "DDAVP challenge"
  - caution in children due to hyponatremia
- tranexamic acid (Cyklokapron®, antifibrinolytic) to stabilize clot formation
- vWF:FVIII concentrate (Humate P®, Wilate®) if DDAVP unresponsive/clinically ineffective or for severe bleeding episode
  - need to monitor vWF and factor VIII levels (very high factor VIII level can be prothrombotic)
  - gynecologic focused care for heavy menstrual bleeding (NB estrogens have the added benefit of increasing vWF levels)

**Prognosis**
- patients with mild type 1 vWD have auto-correction of vWF deficiency in pregnancy
- patients are best managed by a hematologist, ideally one who works in a Hemophilia Treatment Centre (HTC)

**Disorders of Secondary Hemostasis**

**Definition**
- inability to form an adequate fibrin clot
  - disorders of clotting factors or co-factors
  - disorders of proteins associated with fibrinolysis
- characterized by delayed bleeding, deep muscular bleeding, spontaneous hemarthroses

**Table 26 Classification of Secondary Hemostasis Disorders**

**Hemophilia A (Factor VIII Deficiency)**

**Pathophysiology**
- X-linked recessive, 1/5,000 males
- mild (>5% of normal factor level), moderate (1-5%), severe (<1%)

**Clinical Features**
- see Table 19  Signs and Symptoms of Disorders of Hemostasis, H26
- older patients may also have HIV or HCV from contaminated blood products

**Investigations**
- prolonged aPTT, normal INR (PT)
- decreased Factor VIII (<40% of normal)

**Treatment**
- desmopressin (DDAVP®) in mild hemophilia A
  - Factor VIII concentrate for
    - prophylaxis
    - on-demand (i.e. to treat a bleed)
  - anti-fibrinolytic agents (e.g. tranexamic acid)

**Hemophilia B (Factor IX Deficiency)**

- X-linked recessive, 1/30,000 males; approximately half have severe disease (factor IX activity <1% of normal)
- clinical and laboratory features identical to hemophilia A (except decreased Factor IX)
- treatment: Factor IX concentrate (prophylaxis or on-demand), anti-fibrinolytic agents
**Factor XI Deficiency**

- autosomal recessive; more common in Ashkenazi Jewish population
- usually mild, often diagnosed in adulthood
- Fac or XI level does not correlate with bleeding risk – risk of bleeding correlates with a previous history or family history of bleeding
- treatment: antifibrinolytic agents, frozen plasma, Factor XI concentrate

**Liver Disease**

- see Gastroenterology, G32

**Pathophysiology**

- deficient synthesis of all factors except VIII (also made in endothelium)
- aberrant or diminished synthesis of fibrinogen (factor I)
- diminished synthesis of natural anticoagulants and altered regulation of fibrinolysis

**Investigations**

- peripheral blood film: target cells
- primary hemostasis affected
  - thrombocytopenia 2° to hypersplenism, nutritional deficiency, direct bone marrow toxicity related to alcohol, diminished production from chronic viral infections (e.g. HCV), decreased production of thrombopoietin
  - secondary hemostasis affected
  - elevated INR (PT), aPTT and TT, low fibrinogen in end-stage liver disease

**Treatment**

- supportive, treat liver disease, blood products if active bleeding (frozen plasma, platelets, cryoprecipitate)

**Vitamin K Deficiency**

**Etiology**

- drugs
  - vitamin K antagonist (e.g. Warfarin) – diminished production of functional Factors II, VII, IX, X, proteins C and S
  - antibiotics eradicating gut flora, altering vitamin K uptake
  - poor diet (especially in alcoholics) e.g. prolonged fasting or starvation
  - biliary obstruction
  - chronic liver disease (decreased stores)
  - fat malabsorption (e.g. celiac disease, disorders of bile or pancreatic secretion, intestinal disease, CF)
  - hemorrhagic disease of newborn, see Pediatrics, P42

**Investigations**

- INR (PT) is elevated out of proportion to elevation of the aPTT
- decreased Factors II, VII, IX, X (vitamin K-dependent)

**Treatment**

- hold anticoagulant if vitamin K antagonist on board
- vitamin K PO if no active bleeding
- if bleeding give vitamin K 10 mg IV (reversal may take up to 12 h)
- if life threatening bleeding and vitamin K antagonist used, give prothrombin complex concentrate (PCC) or FP if PCC contraindicated
- PCCs are contraindicated if there is a previous history of HIT (heparin is within the PCC product)

**Disseminated Intravascular Coagulation**

**Definition**

- excessive, dysregulated release of plasmin and thrombin leading to intravascular coagulation and depletion of platelets, coagulation factors and fibrinogen
- risk of life-threatening hemorrhage or thromboembolism

**Etiology**

- occurs as a complication of many other severe medical, surgical or obstetrical conditions
- widespread endothelial damage and extensive inflammatory cytokine release
## Hematology

### Hypercoagulable Disorders

#### Hypercoagulability Workup – Venous Thrombosis

- workup for malignancy is suggested in the event of abnormal blood work, constitutional symptoms or physical exam suggestive of cancer
- workup for hypercoagulable state is controversial and should only be done if it will alter treatment decisions
- recommendations for a hypercoagulable workup include:
  - patients with recurrent or multiple thrombosis only if it will change management plans
  - warfarin-induced skin necrosis or neonatal purpura fulminans (protein C or S deficiency)
  - consider for patients with a family history of VTE who are considering OCP use
  - consider for patients who present with thrombosis at an unusual venous site only if it will change management plans
- arterial thrombotic events have only been proven to be associated with APLA, HIT, JAK2 MPNs, and PNH

<td></td>
</tr>
<tr>
<td>RBC: microangiopathic hemolysis</td>
<td></td>
</tr>
</tbody>
</table>

### Investigations

- primary hemostasis: decreased platelets
- secondary hemostasis: prolonged INR (PT), aPTT, TT, decreased fibrinogen and other factors
- fibrinolysis: increased FDPs or D-dimers, short euglobulin lysis time (i.e. accelerated fibrinolysis)
- extent of fibrin deposition: urine output, RBC fragmentation

### Treatment

- recognize early and treat underlying disorder - supportive measures: hemodynamic and/or ventilator support, aggressive hydration, RBC transfusion if severe bleed
- in hemorrhage: replacement of hemostatic elements with platelet transfusion, frozen plasma, cryoprecipitate
  - British Hematology Guidelines:
    - maintain platelets >50 x 10⁹/L, hemoglobin >80 g/L, calcium between 2.2-2.7 mmol/L, and avoid hypothermia
    - 4-5 units of FF if INR >1.5 or aPTT >38
    - 10 units of cryoprecipitate if fibrinogen <1 g/L
    - 1 adult dose of buffy-coat platelets if <10 x 10⁹/L (<20 if febrile, <50 before invasive procedure)
- in thrombotic phase: UFH or LMWH in critically ill, non-bleeding patients

### Hypercoagulable Disorders

#### Differential Diagnosis of Elevated D-Dimer

- Arterial thromboembolic disease (MI, CVA, acute limb ischemia, AFib, intracardiac thrombus)
- Venous thromboembolic disease (DVT, PE)
- DIC
- Preeclampsia and eclampsia
- Abnormal fibrinolysis; use of thrombolytic agents
- Cardiovascular disease, CHF
- Severe infection/sepsis/inflammation
- Surgery-trauma (tissue ischemia, necrosis)
- Systemic inflammatory response syndrome
- Vasocclusive episode of sickle cell disease
- Severe liver disease
- Malignancy
- Renal disease (nephrotic syndrome, acute/chronic renal failure)
- Normal pregnancy
- Venous malformation

#### Levels of fibrinogen can still be normal in DIC as it is an acute phase reactant

#### Serial fibrinogen levels should be measured to see if there is a trending decrease along with an increase in D-dimer

### Important Etiologies of DIC

- Obstetric complications
- Malignancy
- Infection
- Trauma
- Shock

### American Society of Hematology Choosing Wisely Recommendations

1. Do not test for thrombophilia in adult patients with venous thromboembolism occurring in the setting of major transient risk factors (surgery, trauma, or prolonged immobilization)
2. Do not use inferior vena cava filters routinely in patients with acute venous thromboembolism
• workup
  • initial
    • CBC, blood smear, coagulation studies, liver/renal function, urinalysis, hemolysis markers (if anemic)
    • malignancy history, age appropriate cancer screening
    • serology: antiphospholipid antibodies (APLA)
  • post-treatment (or ≥26 wk, as protein levels depleted/consumed by clot)
    • antithrombin (not on heparin)
    • proteins C, S (not on warfarin)
• note: most of these tests do not change management, and a negative test does not rule out a hypercoagulable state
  • thus, more focus on the reversible/treatable causes (APLA, cancer, etc.)

SELECTED CAUSES OF HYPERCOAGULABILITY LEADING TO VENOUS THROMBOEMBOLISM

Activated Protein C Resistance (Factor V Leiden)
• most common cause of hereditary thrombophilia
  • 3–7% of European Caucasian population are heterozygotes
  • point mutation in the Factor V gene (R506Q) results in resistance to inactivation of Factor Va by activated protein C

Prothrombin Gene Mutation (PT) G20210A
• 1 3% of European Caucasian population are heterozygotes
  • G to A transposition at nucleotide position 20210 of the prothrombin gene promoter region results in increased levels of prothrombin, thus increased thrombin generation

Protein C and Protein S Deficiency
• protein C inactivates Factor Va and VIIIa using protein S as a cofactor
  • protein C deficiency
    • homozygous or compound heterozygous: neonatal purpura fulminans
    • heterozygous
      • type I: decreased protein C levels
      • type II: decreased protein C activity
    • acquired: liver disease, sepsis, DIC, warfarin, certain chemotherapeutic agents
    • 1/3 of patients with warfarin necrosis have underlying protein C deficiency
  • protein S deficiency
    • type I: decreased free and total protein S levels
    • type II: decreased protein S activity
    • type III: decreased free protein S levels
    • acquired: liver disease, DIC, pregnancy, nephrotic syndrome, inflammatory conditions, warfarin

Antithrombin Deficiency
• antithrombin slowly inactivates thrombin in the absence of heparin, rapidly inactivates thrombin in the presence of heparin
  • autosomal dominant inheritance, urinary losses in nephrotic syndrome, or reduced synthesis in liver disease
  • diagnosis must be made outside window of acute thrombosis and anticoagulation treatment (acute thrombosis, heparin, systemic disease all decrease antithrombin levels)
  • deficiency may result in resistance to unfractionated heparin (LMWH may be considered, with monitoring of anti-Xa levels)
  • heparin resistance: suspect if >35,000 units of UFH required during 24 h use

Elevated Factor VIII Levels
• an independent marker of increased incident and recurrent thrombotic risk, but levels can also be increased in numerous states as an acute phase reactant, therefore its clinical use is controversial

Congenital Dysfibrinogenemia
• may predispose to thromboembolic disease, bleeding or both

Disorders of Fibrinolysis
• includes congenital plasminogen deficiency, tissue plasminogen activator deficiency, although association with VTE risk is not clear

Antiphospholipid Antibody Syndrome (APS)
• definition: ≥1 clinical and ≥1 laboratory criteria
  • clinical: thrombosis, recurrent (≥3) early pregnancy losses <10 wk, one late fetal loss ≥10 wk (morphologically normal), or premature birth before 34 wk due to (pre)eclampsia or placental insufficiency
  • laboratory: must be confirmed on two occasions, tested ≥12 wk apart): anticardiolipin antibodies, anti-β2 glycoprotein-I antibody, lupus anticoagulant
  • mechanism: not well understood, antibodies interact with platelet membrane phospholipid causing increased activation; can also interfere with thrombin regulation, fibrinolysis, and inhibit the protein C pathway
• see Rheumatology, RH12
Venous Thromboembolism

Definition
- thrombus formation and subsequent inflammatory response in a superficial or deep vein
- superficial thrombophlebitis, deep vein thrombosis (DVT), and pulmonary embolism (PE)
- thrombi propagate in the direction of blood flow (commonly originating in calf veins)
- more common in lower extremity than upper extremity
- incidence ~1% if age >60 yr
- most important sequelae are pulmonary embolism (~50% chance with proximal DVT) and chronic venous insufficiency

Etiology (Virchow’s Triad)
- endothelial damage
  - exposes endothelium to prompt hemostasis
  - leads to decreased inhibition of coagulation and local fibrinolysis
- venous stasis
  - immobilization (post-MI, CHF, stroke, post-operative) inhibits clearance and dilution of coagulation factors
- hypercoagulability
  - inherited (see Hypercoagulable Disorders, H33)
  - acquired
    - age (risk increases with age)
    - surgery (especially orthopedic, thoracic, GI, and GU)
    - trauma (especially fractures of spine, pelvis, femur or tibia, spinal cord injury)
    - neoplasms (especially lung, pancreas, colon, rectum, kidney, and prostate)
    - blood dyscrasias (myeloproliferative neoplasms, especially PV, ET), PNH, hyperviscosity (multiple myeloma, polycythemia, leukemia, sickle cell disease)
    - prolonged immobilization (CHF, stroke, MI, leg injury)
    - hormone related (pregnancy, OCP, HRT, SERMs)
    - APS
  - idiopathic (10-20% are later found to have cancer)

Clinical Features of DVT
- absence of physical findings does not rule out disease
- unilateral leg edema, erythema, warmth, and tenderness; purple-blue colour
- palpable cord (thrombosed vein)
- phlegmasia alba dolens (white appearance) and phlegmasia cerula dolens (acute pain and edema) with massive thrombosis
- Homan's sign (pain with foot dorsiflexion) is unreliable

Differential Diagnosis of DVT
- muscle strain or tear, lymphangitis or lymph obstruction, venous valvular insufficiency, ruptured popliteal cysts, cellulitis, arterial occlusive disease

Investigations for DVT
- D-dimer test only useful to rule out DVT if negative with low clinical suspicion of disease and no other acute medical issues
- doppler ultrasound is most useful diagnostic test for DVT
  - sensitivity and specificity for proximal DVT ~95%
- sensitivity for calf DVT ~70%
- other non invasive tests include MRA and impedance plethysmography
- venography is the gold standard, but is expensive, invasive, and higher risk
- CTPA or V/Q scan if PE suspected

Post-Thrombotic Syndrome
- development of chronic venous stasis signs and symptoms secondary to a deep venous thrombosis
- symptoms: pain, venous dilatation, edema, pigmentation, skin changes, venous ulcers
- clinical severity can be estimated based on the Villalta score
- large impact on quality of life following a DVT
- treatment: extremity elevation, exercise, continuous compression stockings, intermittent pneumatic compression therapy, skin/ulcer care
- for clinical features and treatment of PE, see Respirology, R18

Low Molecular-Weight Heparin vs. Coumarin for the Prevention of Recurrent Venous Thromboembolism in Patients with Cancer
NEJM 2003;349:146-153

Study: RCT comparing the efficacy of LMWH (dalteparin) with an oral anti-coagulant agent (coumarin) in preventing recurrent thrombosis in patients with cancer.

Methods: Patients with cancer who had acute symptomatic proximal DVT, PE, or both were randomly assigned to either dalteparin or coumarin treatment for 6 mo.

Results: 27 of 336 patients in the dalteparin group had recurrent VTE versus 53 of 336 patients in the coumarin group (hazard ratio, 0.46; p=0.002). The probability of recurrent thromboembolism at 6 mo was 9% and 17% in dalteparin and coumarin groups respectively. There was no significant difference in bleeding rates. The mortality rate was 39% in the dalteparin group and 41% in the coumarin group.

Conclusions: In patients with cancer and acute VTE, dalteparin was more effective than coumarin in decreasing the risk of recurrent thromboembolism without increasing the risk of bleeding.
**Approach to Treatment of Venous Thromboembolism**

**Purpose**
- prevent further clot extension (3 mo duration is optimal)
- prevent acute pulmonary embolism (occurs in up to 50% of untreated patients)
- reduce the risk of recurrent thrombosis (duration depends on presence of other risk factors)
- treatment of massive iliofemoral thrombosis with acute lower limb ischemia and/or venous gangrene (phlegmasia cerulea dolens)
- limit development of late complications (e.g. postphlebitic syndrome, chronic venous insufficiency, and chronic thromboembolic pulmonary HTN)

**Initial Treatment**
- low molecular weight heparin (LMWH)
  - administered SC, at least as effective as UFH with a lower bleeding risk
  - advantages: predictable dose response and fixed dosing schedule; lab monitoring not required; <1% HIT; safe and effective outpatient therapy
  - disadvantages: only partially reversible by protamine long-term use associated with osteoporosis co therapy
  - renal clearance
- unfractionated heparin (UFH)
  - in patient with average risk of bleed; use hospital-based nomograms that use bleeding risk and patient weight to determine appropriate dose
  - advantages: rapidly reversible by protamine
  - disadvantages: must monitor aPTT or heparin levels with adjustment of dose to reach therapeutic level (~2x normal value); monitor platelet counts for development of HIT
- alternatives to LMWH and UFH
  - direct thrombin inhibitors (hirudin, lepirudin, argatroban)
  - direct factor Xa inhibitors (apixaban, rivaroxaban)
  - thrombolytic drugs (e.g. streptokinase, tPA) reserved for acute limb/life-threatening thrombosis, and low bleeding risk

**Long-Term Treatment**
- anticoagulation therapy
  - warfarin
    - standard treatment; should be initiated with heparin overlap: dual therapy for at least 48 hours with INR >2, due to initial prothrombotic state secondary to warfarin's inhibition of natural anticoagulants protein C/S, half-life of vitamin K factors and risk of warfarin-induced skin necrosis
  - INR: warfarin dosed to maintain INR at 2-3, monitor twice weekly for 1-2 wk. Discontinue heparin after INR =2.0 for 2 consecutive days
  - direct oral anticoagulants (DOACs)
    - apixaban or rivaroxaban; with no laboratory monitoring required, patients with CrCl > 50 ml/min
    - dabigatran (factor IIa inhibitor): LMWH or IV heparin for at least 5-10 days before initiating dabigatran, patients with CrCl >30 ml/min
    - important drug interactions to consider for DOACs (no relevant food interactions however)
    - cancer patients: LMWH more effective than warfarin at preventing recurrence of venous thrombosis in cancer patients
  - duration of anticoagulant treatment
    - provoked VTE with transient risk factor: 3 mo
    - provoked VTE with ongoing risk factor: consider indefinite therapy with annual reassessment
    - first unprovoked VTE: at least 3 mo, subsequent reassessment
    - unprovoked proximal DVT or PE: consider indefinite therapy with annual reassessment
    - second unprovoked VTE: consider indefinite therapy
    - cancer-associated DVT: at least 3 mo, longer if continued evidence of cancer
  - IVC filters
    - temporary filter indicated only if acute DVT (<4 wk) with significant contraindications to anticoagulant therapy (e.g. active bleeding) or if require interruption of anticoagulation (i.e. for urgent surgery)
    - must be retrieved once safe to do so as filter is pro-thrombotic in the long-term (consider anticoagulation if not retrieved)
  - special considerations
    - pregnancy: treat with LMWH during pregnancy, then LMWH or warfarin for 6 wk post-partum (minimum total anticoagulation time of 3-6 mo, but must include 6 wks post-partum, as this is a high risk period); avoid warfarin in pregnancy due to teratogenicity
    - surgery: avoid elective surgery in the first three months after a venous thromboembolic event
      - pre-operatively: IV heparin may be used up to 4-6 h pre-operatively
      - perioperatively: warfarin or DOACs discontinued for at least 3-5 d pre-operatively (consider mechanism of drug clearance)
        - surgery safe when INR <1.5 off of warfarin, normal PTT on dabigatran, drug-specific Xa level at zero for apixaban/ rivaroxaban/LMWH, normal PTT on IV unfractionated heparin

---

**Duration of Treatment with Vitamin K Antagonists in Symptomatic Venous Thromboembolism**

Cochrane GB Syt Rev 2009;CD001367

**Study:** Meta-analysis of 8 RCTs (2,994 patients) comparing different durations of treatment with vitamin K antagonists in patients with symptomatic VTE

**Results:** In patients treated with vitamin K antagonists for a prolonged period, the reduction in risk of recurrent VTE remained consistent regardless of the period of treatment (OR 0.18; 95% CI 0.13-0.28). In addition, there was no difference in risk of major bleeding complications (OR 2.81; 95% CI 1.49-4.82).

**Conclusion:** Prolonged treatment with vitamin K antagonists leads to a consistent reduction in the risk of recurrent VTE for as long as therapy is continued. Therapy should be discontinued when the risk of bleeding exceeds the risk of recurrence of VTE (which declines over time). No specific recommendation was made regarding optimal duration of treatment.

---

**Common Medications that Interact with Warfarin**
- Acetaminophen (interference with vitamin K metabolism)
- Aplinpranolol
- NSAIDs (GI injury)
- Fluconazole
- Metronidazole
- Sulfamethoxazole
- Tamoxifen

---

**Initiation of Warfarin Therapy Requires Bridging with Heparin Therapy for 4-5 Days**

- 10 mg loading dose (for example) of warfarin causes a precipitous decline in protein C levels in first 36 h resulting in a transient hypercoagulable state
- Warfarin decreases Factor VIII levels in first 48 h, INR is prolonged (most sensitive index to Factor VIII levels), however full antithrombotic effect is not achieved until Factor IX, X, and II are sufficiently reduced (occurs after ~4 d)

---

**Low Risk Surgical Patients**
- <40 yr, no risk factors for VTE, general anesthetic (GA) <30 min, minor elective abdominal, or thoracic surgery

**Moderate Risk Surgical Patients**
- >40 yr; 1 risk factor for VTE, GA >30 min

**High Risk Surgical Patients**
- >40 yr, surgery for malignancy or lower extremity orthopedic surgery lasting >30 min, inhibitor deficiency or other risk factor

**High Risk Medical Patients**
- Heart failure, severe respiratory disease, ischemic stroke and lower limb paralysis, confined to bed and have
- >1 additional risk factor (e.g. active cancer, previous VTE, sepsis, acute neurologic disease, IBD)
**Hematologic Malignancies and Related Disorders**

**Myeloid Malignancies**

**Acute Myeloid Leukemia**

**Definition**
- rapidly progressive malignancy characterized by failure of myeloid cells to differentiate beyond blast stage

**Epidemiology**
- incidence increases with age; median age of onset is 65 yr old; 80% of acute adult leukemias
- accounts for 10-15% of childhood leukemias

**Figure 14. Overview of hematologic malignancies and related disorders**

Risk Factors
- myelodysplastic syndromes (MDS), benzene, radiation, Down Syndrome, alkylating agents as treatment for previous malignancy

Pathophysiology
- etiology subdivided into:
  - primary: *de novo*
  - secondary: hematologic malignancies (e.g. myeloproliferative disorders and MDS) or previous chemotherapeutic agents (e.g. alkylating agents)
- uncontrolled growth of blasts in marrow leads to:
  - suppression of normal hematopoietic cells
  - appearance of blasts in peripheral blood – risk of leukostasis
  - accumulation of blasts in other sites (e.g. skin, gums)
  - metabolic consequences; tumour lysis syndrome

Clinical Features
- anemia, thrombocytopenia (associated with DIC in promyelocytic leukemia), neutropenia (even with normal WBC), leads to infections, fever
- accumulation of blast cells in marrow
  - skeletal pain, bony tenderness (especially sternum)
- organ infiltration
  - gingival hypertrophy (particularly myelomonocytic leukemia) – may present to dentist first
  - hepatosplenomegaly (in ALL)
  - lymphadenopathy (not marked in ALL)
  - gonads (in ALL)
  - skin: leukemia cutis or myeloid sarcoma
  - eyes: hemorrhages and/or whitish plaques, Roth spots, cotton wool spots, vision changes (uncommon)
- leukostasis/hyperleukocytosis syndrome (medical emergency)
  - large numbers of blasts interfere with circulation and lead to hypoxia and hemorrhage – can cause diffuse pulmonary infiltrates, CNS bleeding, respiratory distress, altered mental status, priapism
  - associated with AML more than ALL
- metabolic effects; aggravated by treatment (rare)
  - increased uric acid → nephropathy, gout
  - release of phosphate → decreased Ca²⁺, decreased Mg²⁺
  - release of procoagulants → DIC (higher risk in acute promyelocytic leukemia)
  - decreased or normal K⁺ before treatment, increased K⁺ after treatment (from lysed cells)

Investigations
- blood work
  - CBC: anemia, thrombocytopenia, variable WBC
  - INR, aPTT, fibrin degradation products (FDP), fibrinogen (in case of DIC)
  - increased LDH, increased uric acid, increased PO₄³⁻ (released by leukemic blasts), decreased Ca²⁺, decreased K⁺
  - baseline renal and liver function tests
- peripheral blood film – circulating blasts with Auer rods (azurophilic granules) are pathognomonic for AML
- bone marrow aspirate for definitive diagnosis
  - blast count: AML >20% (normal is <5%)
  - morphologic, cytochemical, and/or immunophenotypic features are used to establish lineage and maturation (see sidebar for WHO classification of AML H37)
- CXR to rule out pneumonia, ECG, MUGA scan prior to chemotherapy (cardiotoxic)

Treatment
- mainstay of treatment is chemotherapy (rapidly fatal without treatment)
- all AML subtypes are treated similarly, except acute promyelocytic leukemia (APL) with t(15:17) translocation
- all-trans-retinoic acid (ATRA) added to induce differentiation; arsenic trioxide + ATRA combination therapy for APL is non-inferior to traditional chemotherapy
- treatment strategy
  1. *Induction*: chemotherapy to induce complete remission of AML (see sidebar)
     - several possible regimens (e.g. cytarabine with anthracycline [daunorubicin])
     - patients with poor response to initial induction therapy – worse prognosis
     - must ensure reversal of DIC, platelet transfusions if <10
  2. *Consolidation*: to prevent recurrence
     - intensive consolidation chemotherapy
     - stem cell transplantation – autologous or allogeneic (younger patients with better performance status)
- consider acceleration with hematopoietic growth factors (e.g. G-CSF) if severe infection develops
• supportive care
  • screening for infection via regular C&S of urine, stool, sputum, oropharynx, catheter sites, perianal area
  • fever: C&S of all orifices, CXR, start antibiotics
  • platelet and RBC transfusions (irradiated to prevent transfusion-related GVHD) + EPO
  • prevention and treatment of metabolic abnormalities
  • allopurinol, rasburicase for prevention of hyperuricemia

Prognosis
• achievement of first remission
  • 70-80% if ≤60 yr old, 50% if >60 yr old
  • median survival 12-24 mo
  • prognosis is most related to 1) cytogenetics; classified as favourable, intermediate, or adverse and 2) molecular studies (i.e. NPM1+/FLT3- mutations)
  • prognosis depends on cytogenetics, age, performance status, prior cytotoxic agents or radiation therapy

Myelodysplastic Syndromes

Definition
• heterogeneous group of malignant stem cell disorders characterized by dysplastic and ineffective blood cell production resulting in peripheral cytopenias, and a variable risk of transformation to acute leukemias
• syndromes defined according to World Health Organization (WHO) classifications (see sidebar)

Pathophysiology
• disordered maturation: ineffective hematopoiesis despite presence of adequate numbers of progenitor cells in bone marrow (usually hypercellular); formed elements sometimes exhibit qualitative functional defects
• intramedullary apoptosis: programmed cell death within bone marrow
  • both processes lead to reduced mature cells in periphery
  • <30% develop AML

Risk Factors
• elderly, post-chemotherapy, exposures (benzene, tobacco, radiation), inherited genetic abnormalities
• occurs in 4/100,000 patients >60 yr old

Clinical Features
• insidious onset: associated with pancytopenia; most patients asymptomatic at diagnosis
• infections and bleeding out of proportion with peripheral blood counts

Investigations
• diagnosed by:
  • anemia ± thrombocytopenia ± neutropenia
  • CBC and peripheral blood film
  • RBC: usually macrocytic with oval shaped red cells (macro-ovalocytes), decreased reticulocyte count
  • WBC: decreased granulocytes and abnormal morphology (e.g. bi-lobed or unsegmented nuclei = Pelger abnormality)
  • platelets: thrombocytopenia, abnormalities of size and cytoplasm (e.g. giant hypogranular platelets)
• bone marrow aspirate and biopsy with cytogenetic analysis required for definitive diagnosis
• bone marrow: dysplastic and often normocellular/hypercellular
• cytogenetics: high risk include partial or total loss of chromosomes 5, 7, and complex (>3 abnormalities)

Treatment
• low risk of transformation to acute leukemia (IPSS-R Very Low or Low)
  • erythropoietin stimulating agents weekly is first line in reducing transfusion requirements (EPO level must be <500)
  • If 5q deletion based on cytogenetics: lenalidomide PO
  • supportive care: RBC and platelet transfusion (consider iron chelation if frequent RBC transfusions)
  • high risk of transformation to acute leukemia (IPSS-R Intermediate, High or Very High)
  • supportive care
  • stem cell transplantation if age <65 yr
  • epigenetic therapy: DNA methyltransferase inhibitors (e.g. 5-azacytidine), histone deacetylase inhibitors

Prognosis
• Revised International Prognostic Scoring System (IPSS-R) uses 5 factors to estimate mean survival:
  • cytology, % bone marrow blasts, hemoglobin, platelets, absolute neutrophil count
  • based on the calculated score, a patient’s MDS prognostic risk is “Very Low,” “Low,” “Intermediate,” “High,” or “Very High” with a mean survival of 8.7, 5.3, 3.0, 1.6, and 0.8 yr, respectively
Myeloproliferative Neoplasms

Definition
- clonal myeloid stem cell abnormalities leading to overproduction of one or more cell lines (leading to abnormalities in erythrocytes, platelets, and other cells of myeloid lineage)

Epidemiology
- mainly middle-aged and older patients (peak 60-80 yr)

Prognosis
- may develop marrow fibrosis with time
- all disorders may progress to AML

Chronic Myeloid Leukemia

Definition
- myeloproliferative disorder characterized by increased proliferation of the granulocytic cell line without the loss of their capacity to differentiate

Epidemiology
- occurs in any age group (mostly middle age to elderly) with a median age of 65 yr

Pathophysiology
- Philadelphia chromosome (Ph)
  - translocation between chromosomes 9 and 22
  - the c-Abl proto-oncogene is translocated from chromosome 9 to "breakpoint cluster region" (BCR) of chromosome 22 to produce BCR-Abl fusion gene, an active tyrosine kinase

Clinical Features
- 3 clinical phases
  - chronic phase: 85% diagnosed here
    - few blasts (<10%) in peripheral film
    - ± slightly elevated eosinophils and basophils
    - no significant symptoms
  - accelerated phase: impaired neutrophil differentiation
    - circulating blasts (10-19%) with increasing peripheral basophils (pruritus)
    - CBC: thrombocytoopenia <100 x 10⁹/L
    - cytogenetic evidence of clonal evolution
    - worsening constitutional symptoms and splenomegaly (extramedullary hematopoiesis)
    - blast crisis: more aggressive course, blasts fail to differentiate
  - blast crisis: blasts (>20%) in peripheral blood or bone marrow; reflective of acute leukemia (1/3 ALL, 2/3 AML)
- clinical presentation
  - 20-50% of patients are asymptomatic when diagnosed (incidental lab finding)
  - nonspecific symptoms
    - fatigue, weight loss, malaise, excessive sweating, fever
    - secondary to splenic involvement
    - early satiety, LUQ pain/fullness, shoulder tip pain (referred)
    - splenomegaly (most common physical finding)
  - anemia
  - bleeding: secondary to platelet dysfunction
  - pruritus, PUD secondary to increased blood histamine
  - leukostasis, priapism, encephalopathy (rare): secondary to very elevated WBC (rare)

Investigations
- elevated WBC, decreased/normal RBC, increased/decreased platelets, increased basophils
- WBC differential shows a bimodal distribution, with predominance of myelocytes and neutrophils
• peripheral blood film
  • leukoerythroblastic picture (immature red cells and granulocytes present, e.g. myelocytes and normoblasts)
  • presence of different mid-stage progenitor cells differentiates it from AML.
• bone marrow
  • myeloid hyperplasia with left shift, increased megakaryocytes, mild fibrosis
• molecular and cytogenetic studies of bone marrow or peripheral blood for Philadelphia chromosome
• abdominal imaging for spleen size

Treatment
• symptomatic
  • allopurinol and antihistamines
• chronic phase
  • imatinib mesylate inhibits proliferation and induces apoptosis by inhibiting tyrosine kinase activity in cells positive for bcr abl
  • if loss of response or intolerance (~40%), trial of 2nd generation TKIs: dasatinib, nilotinib, or bosutinib
  • dasatinib and nilotinib may also be considered for first line management
• interferon-α: may improve response to tyrosine kinase inhibitors; typically now only used for pregnant patients
• hydroxyurea in palliative setting to reduce WBC
• accelerated phase or blast phase
  • refer for clinical trial or 2nd/3rd generation TKI and prepare for allogeneic stem cell transplant patients, in blast phase typically get standard AML induction
  • stem cell transplantation may be curative: to be considered in young patients who do not meet therapeutic milestones
• treatment success is monitored based on therapeutic milestones
  • hematologic: improved WBC and platelet counts, reduced basophils
  • cytogenetic: undetectable Philadelphia-chromosome in the bone marrow
• molecular: reduction/absence of bcr-abl transcripts in periphery and marrow

Prognosis
• survival dependent on response
  • those achieving complete cytogenetic response (CCR) on imatinib by 18 mo of therapy: 6 yr overall survival >90%
  • those who do NOT achieve CCR on imatinib: 6 yr overall survival of 66%
• acute phase (blast crisis – usually within 3-5 yr)
  • 2/3 develop a picture similar to AML
  • unresponsive to remission induction
  • 1/3 develop a picture similar to ALL
• remission induction (return to chronic phase) achievable

Polycythemia Vera

Definition
• stem cell disorder characterized by elevated RBC mass (erythrocytosis) ± increased white cell and platelet production
• diagnosis (WHO 2016) requires meeting either all 3 major criteria, or the first 2 major criteria and the minor criterion
  • Major Criteria
    1. hemoglobin >165 g/L in men, >160 g/L in women, OR Hct >49% in men or >48% in women, OR increased red cell mass (>25% above mean normal predicted value)
    2. bone marrow biopsy showing hypercellularity for age with trilineage growth (panmyelosis) with prominent erythroid, granulocytic, and megakaryocytic proliferation
    3. presence of JAK2 V617F or JAK2 exon 12 mutation
  • Minor Criteria
    1. serum erythropoietin level below reference range for normal (must have at least two major criteria if using erythropoietin level)

Clinical Features
• symptoms are secondary to high red cell mass and hyperviscosity (see Erythrocytosis, H6)
• thrombotic complications: DVT, PE, Budd-Chiari (hepatic vein thrombosis), portal vein thrombosis, thrombopelbitis, increased incidence of stroke, MI
• due to increased blood viscosity, increased platelet number and/or activity
• bleeding complications: epistaxis, gingival bleeding, ecchymoses, and GI bleeding
• if high platelet counts with associated acquired vWD
• erythromelalgia (burning pain in hands and feet and erythema of the skin)
  • associated with platelets >800 x 10^9/L
• pathognomonic microvascular thrombotic complication in PV and ET
• urtis, especially after warm bath or shower (40%) due to cutaneous mast cell degranulation and histamine release
• epigastric distress, PUD
• due to increased histamine from tissue basophils, alterations in gastric mucosal blood flow due to increased blood viscosity

Cardiovascular Events and Intensity of Treatment in Polycythemia Vera

Nejm 2013;368:22-33

Study: Prospective, RCT, mean follow-up of 28.9 mo. Binding not described.

Population: 365 patients with JAK2-positive polycythemia vera being treated with phlebotomy, hydroxyurea, or both.

Intervention: Patients were randomized to a target hematocrit <45% (low-hematocrit group) or 45-50% (high-hematocrit group).

Outcome: Composite of time until death from cardiovascular causes of major thrombotic events.

Results: The hazard ratio (HR) for the primary outcome was 3.9 (95% CI 1.45-10.3, p=0.007), while the HR for the primary outcome plus superficial veinous thrombosis was 2.69 (95% CI 1.19-6.12, p=0.022) for the high-hematocrit vs. low-hematocrit group.
